Re: PPG – Site 107, Laboratory Job No. 460-34686-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Conrail

Fractions

Hexavalent chromium (Cr⁺⁶)

Laboratory: TestAmerica Laboratories, Inc.

Total Vanadium (V)

pH / Eh ; ORP

Report No.: 460-34686-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Field Sample ID	Lab ID	Matrix	Date Collected	Analysis

S = Non-Aqueous Matrix
A = Aqueous Matrix

Total Samples = 60 (Cr⁺⁶) ; 43 (V)
Bold Type indicates sample taken as a Batch QC sample

All samples were received one day from collection. Samples were received on ice at recorded temperatures of -3.1 and 1.9 °C. No sample condition issues were noted in the sample receipt log ; no QA action was necessary.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤24 hours for aqueous matrix; ≤30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination.

Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The matrix spike recovery for soluble Cr⁺⁶ in batch QC sample MO28W-3.0 (460-34686-58) was below the lower limit, with the sample native (unspiked) concentration >4x spike-added concentration (272 mg/Kg vs. 43 mg/Kg spiked). The sample was not re-spiked and re-analyzed; per NJDEP DV guidance, no further action is necessary and associated results are acceptable for use, therefore no QA action was taken.

SECTION D Total Metals (V)

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference. No positive element results were reported for the field blank sample.

SECTION E ReDox Characteristics

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found.

SECTION F COLLOCATED SAMPLES

Precision of collocated samples is being reported separately.

SECTION G Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,

Environmental Quality Associates, Inc.

S = Non-Aqueous Matrix
A = Aqueous Matrix

Total Samples = 35 (Cr⁺⁶) ; 33 (V)
Bold Type indicates sample taken as a Batch QC sample

All samples were received one day from collection. Samples were received on ice at recorded temperatures of -5.5 and 4.6 °C. No sample condition issues were noted in the sample receipt log ; no QA action was necessary.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤24 hours for aqueous matrix; ≤30 days for non-aqueous matrix) were met for all samples, with the following exceptions:

Samples 107_MO20N_4.0, 107_MO20N_3.5, 107_MO20E2_3.5 and 107_MO20E2_4.0 (Lab IDs 460-34781-7, 6, 78 and 79, respectively) were initially digested and analyzed within the 30-day hold time. Due to soluble MS recovery above the upper limit (142% vs. 125%), the batch required re-digestion and re-analysis, which was performed 12 days outside holding time. *Although the re-digestion analysis soluble MS recovery was within limits, these results are not usable, since the extended hold time (i.e., >32 days from collection) is a rejectable deficiency. Therefore, it is recommended that the data user accept the initial results for the noted QC batch sample group, qualified as estimated 'J', with indication of potential high bias based on the initial prep and analysis high MS recovery.*

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination.

Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The matrix spike recovery for soluble Cr⁺⁶ in batch QC sample 107_MO20N_4.0 (Lab ID: 460-34781-7) was above the upper limit (at 142%). Although the sample and associated QC batch samples were re-digested, re-spike and re-analyzed, this was performed 42 days from collection; per NJDEP DV guidance all samples which are digested / analyzed beyond 32 days from collection are rejected. Therefore, the initial batch results are qualified estimated 'J', with indication of potential high bias.

The matrix duplicate precision result for Cr⁺⁶ in batch QC sample 107_MO20N_4.0 (Lab ID: 460-34781-7) exceeded the applicable limit of 20% RPD, at 53%. Refer to comments regarding holding time exceedance above; all associated batch samples are qualified as estimated 'J', due to duplicate precision limit exceedance.

No ORP values were reported for samples 107_MO20N_3.5 and 107_MO20N_4.0. It is noted that all other non-aqueous samples reported in this SDG indicated oxidizing tendency based on measured ORP values.

SECTION D
Total Metals (V)

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

No positive element results were reported for the field blank sample (FB121311).

SECTION E
ReDox Characteristics

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found.

SECTION F
COLLOCATED SAMPLES

Precision of collocated samples is being reported separately.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Field Sample ID	Lab ID	Matrix	Date Collected	Hex. Cr	Metals (V)
107_MO20E1_0.0	460-00034820-001	S	12/14/11		X
107_MO20E1_1.0	460-00034820-002	S	12/14/11	X	X

QC Sample	460-00034820-056	S	12/14/11	X	

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 43 (Cr⁺⁶) ; 49 (V)**Bold Type** indicates sample taken as a Batch QC sample

All samples were received one day from collection. Samples were received on ice at recorded temperatures of -2.7 and 3.4 °C. No sample condition issues were noted in the sample receipt log ; no QA action was necessary.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination.

Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were analyzed at dilution volumes due to Cr^{+6} concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The matrix spike recoveries for soluble and insoluble Cr^{+6} in SDG batch QC sample 108_M018N_3.0 (Lab ID: 460-34820-33) were below the lower limit, and below 50% on initial and re-analysis, affecting associated samples (34820-032, 033, 034. Positive Cr^{+6} results for these samples were flagged as estimated 'J', with indication of significant low bias, since the samples were characterized as oxidizing in nature, which should support the presence of hexavalent chromium.

The matrix spike recoveries for soluble Cr^{+6} in SDG batch QC sample REP121411-3 (Lab ID: 460-34820-48) were below the lower limit, but above 50% on initial and re-analysis, affecting associated samples (34820-009, 010, 023, 024, 025, 029030, 031, 038, 039, 040, 041, 042, 043, 048, 049, 050, 051 and 052. Positive Cr^{+6} results for these samples were flagged as estimated 'J', and non-detect results flagged 'UJ', with indication of low bias, since the samples were characterized as oxidizing in nature, which should support the presence of hexavalent chromium.

SECTION D Total Metals (V)

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found. It is noted that the native sample concentrations for vanadium in QC batch samples 34820-2 and 34820-51 exceeded the spike-added concentration by $\gg 4x$, thus obviating meaningful recovery information from these samples. No QA action was necessary.

No positive element results were reported for the field blank sample.

SECTION E
ReDox Characteristics

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found.

SECTION F
COLLOCATED SAMPLES

Precision of collocated samples is being reported separately.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: CONRAIL - PPG Site , Laboratory Case No. E12-11760

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: CONRAIL - PPG Site

Fractions

Hexavalent chromium (Cr⁺⁶)
pH / Eh ; ORP

Laboratory: Integrated Analytical Laboratories, LLC

Report No.: E12-11760

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by Integrated Analytical Laboratories, LLC (IAL), NJ Laboratory ID Cert. No. 14751. Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

FB-112912	11760-038	A	11/29/12	X

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 26

Bold Type indicates sample taken as a Batch QC sample*Italic type* indicates samples are collocated field duplicates

All samples were received one day from collection. Samples were received on ice at recorded temperature of -4°C. No sample condition issues were noted in the sample receipt log ; no QA action was necessary.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, laboratory duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. When samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range, reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

No data validation qualifiers were necessary for the reported hexavalent chromium results.

SECTION D
Total Metals

No samples in this SDG were requested for total metals analysis.

SECTION E
pH / Eh (ORP) / Ferrous Iron / Sulfide

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

REP112912-1 was identified as being collocated with 108_M018N_2_1.5-2.0, and REP112912-2 was identified as being collocated with 108_M018W2_2_4.0-4.5. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x RL

	REP112912-1	M018N_2_1.5-2.0	%RPD *
Cr (VI)	0.489	3.48	2.99 *
	REP112912-2	M018W2_2_4.0-4.5	
Cr (VI)	0.998	5.82	4.82 *

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x RL values, and difference >2x RL if either sample is <5x CRQL. It is noted that the precision values (based on absolute concentration difference) for the identified collocated sample pairs exceed this criterion, signifying sample matrix non-homogeneity and potential impact on sample representativeness. No data qualifiers were applied by the reviewer; however the data user should incorporate this information in assessing overall data usability.

Dresdner-Robin

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 22

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day after collection. Samples were received on ice at recorded temperature of 2.4°C.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, duplicate precision, and matrix and post-spike recoveries. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr⁺⁶ was not detected in Field Blank FB-1.

No collocated field duplicate samples were identified for this sample delivery group.

SECTION D
Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The recovery for antimony (Sb) in the matrix spike of sample 107_G032_3.5 (Lab ID# 460-22438-2) was below the lower limit of 75%, at 67%. Results for Sb in associated field samples were flagged as estimated values 'UJ' or 'J', with indication of low bias due to matrix effects. The associated LCS recoveries for Sb were within acceptable limits, indicating analytical process control.

It is noted that no post-digestion spike sample was reported for this delivery group. A serial dilution sample was reported, with acceptable precision shown; however, for Sb, none of the reported results were above the minimum threshold values for meaningful precision interpretation. Therefore, the indication of low bias for reported Sb results based on matrix spike recovery is maintained.

No positive element results were reported for the field blank sample (FB-1).

No collocated field duplicate samples were identified for this sample delivery group.

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges; reported spike recoveries were within specified limits.

Dresdner-Robin

Mr. Douglas Neumann

19 April, 2011

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Middletown, New York 10940

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Sample ID 107_-	Lab ID 460-22465-	Matrix	Date Collected	Analysis	
				Hex Cr	Metals

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 36

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day after collection. Samples were received on ice at recorded temperatures of 0.2 and 5.3°C.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr^{+6} was not detected in Field Blank FB-1.

Matrix spike recoveries for soluble Cr^{+6} in samples 460-22465-18 and -32 (107_G036_5.0 and 107_G038_6.0, respectively) were below the allowable limit of 75% in both initial and re-analyses, with recoveries in sample 460-22465-18 below 50% (49%, 17%).

- QA Action: 1) Qualify Cr^{+6} results in batch samples associated with 460-22465-18 (samples 1 – 20) as rejected, 'R', per NJDEP SOP No. 5.A.10, Rev.3, Sect. VI.(D).7.D.8)e). See Data Usability comments below.

2) Qualify Cr^{+6} results in batch samples associated with 460-22465-32 (samples 21 – 35) as estimated, 'UJ' or 'J', with the potential for low bias. See Data Usability comments below.
- Data Usability: 1) Eh / pH results were evaluated to determine ReDox characteristics of batch samples as an indicator of ability to support Cr^{+6} . The following associated batch samples were characterized as "Reducing" based upon the Method 3060A, Table 2 phase diagram: 460-22465- 4, -5, -8, -14, -15, -17, -18; these samples are not likely to support the presence of Cr^{+6} , or if positive, may be low-biased.

2) Eh / pH results were evaluated to determine ReDox characteristics of batch samples as an indicator of ability to support Cr^{+6} . The following associated batch samples were characterized as "Reducing" based upon the Method 3060A, Table 2 phase diagram: 460-22465- 21, -22, -24, -28, -29, -30; these samples are not likely to support the presence of Cr^{+6} .

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The duplicate precision values for chromium (Cr) and nickel (Ni) in the matrix duplicate of sample 107_G038_6.0 (Lab ID# 460-22465-32) were above the upper limit of 20% RPD, at 22% and 21%, respectively. The duplicate precision value for nickel in the matrix duplicate of sample REP012511-2 (Lab ID# 460-22465-35) was above the upper limit of 20% RPD, at 49%.

- QA Action: 1) Qualify Cr and Ni results in associated samples 460-22465-29 through -34 (inclusive) as estimated, 'UJ' or 'J', with indeterminate bias direction.

 2) Qualify Ni in sample REP012511-2 and its collocated sample 107_E034-3.5 as estimated, 'J', with indeterminate bias direction.

No positive element results were reported for the field blank sample (FB-1).

SECTION E pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample spike recoveries are outside acceptable recovery ranges; refer to the data usability section above.

SECTION F COLLOCATED SAMPLES

107_REP012511-1 and 107_REP012511-2 were identified as being collocated with I036_3.5 and E034_3.5, respectively. Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	I036_3.5	R012511-1	%RPD	E034_3.5	R012511-2	%RPD*
Chromium	81.6	64.9	22.8	39.6	100	86.5
Nickel	18.2	24.5	29.5	43.1	51.1	17.0
Antimony	ND	ND	nc	ND	1.9	1.9 *
Thallium	ND	ND	nc	ND	ND	nc
Vanadium	28.6	28.9	1.0	22.0	21.9	0.5
Cr (VI)	ND	ND	nc	2.6	3.1	0.5 *

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL.

- QA Action: Qualify total chromium results in E034_3.5 and 107_REP012511-2 as estimated, 'J', due to collocated sample precision in exceedance of guidance threshold. Bias direction is indeterminate.

SECTION G Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 35

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day after collection. Samples were received on ice at recorded temperature of 2.3°C.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, duplicate precision, and matrix and post-spike recoveries. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr^{+6} was detected in Field Blank FB-1, at 1.8 J ug/L; this is equivalent to a nominal value of 0.072 mg/Kg. For qualification assessment, associated positive Cr^{+6} soil results below 3x adjusted nominal value are negated, while results $>3x$ but $<10x$ adjusted nominal values are qualified as estimated, 'J', with indication of positive bias.

- QA Action: The reported Cr^{+6} result for sample 460-22506-9 (107_I038_17.0) was $>3x$ but $<10x$ the adjusted nominal Field Blank value, and was flagged as estimated, 'J', with indication of positive bias due to field blank contamination.

No collocated field duplicate samples were identified for this sample delivery group.

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The duplicate precision values for chromium (Cr) and nickel (Ni) in the matrix duplicate of sample 460-22465-32 were above the upper limit of 20% RPD, at 22% and 21%, respectively. It is noted that although this batch duplicate sample was not from this SDG's samples, it is from this site, and thus may be considered to be of similar matrix type.

- QA Action: Qualify Cr and Ni results in associated samples 460-22506-21 through -34 (inclusive) as estimated, 'UJ' or 'J', with indeterminate bias direction.

It is noted that no post-digestion spike sample was reported for this delivery group. Serial dilution samples were reported, with acceptable precision.

No positive element results were reported for the field blank sample (FB012611).

No collocated field duplicate samples were identified for this sample delivery group.

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges; reported spike recoveries were within specified limits.

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 36

Bold Type indicates sample taken as a Batch QC sample

All samples were received on the same day as collected. Samples were received on ice at recorded temperature of 3.1°C.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, duplicate precision, and matrix and post-spike recoveries. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr^{+6} was not detected in Field Blank FB-1.

SECTION D
Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

No positive element results were reported for the field blank sample (FB-1).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges; refer to the data usability section above.

SECTION F
COLLOCATED SAMPLES

Sample 107_REP012811-1 was identified as being collocated with sample 107_I042_3.5. Precision results are tabulated below.

Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	I042_3.5	R012811-1	%RPD *
Chromium	26.7	24.5	8.6
Nickel	15.5	21.3	5.8 *
Antimony	1.1	ND	1.1 *
Thallium	ND	ND	nc
Vanadium	22.1	25.7	3.6 *
Cr (VI)	ND	5.9	5.9 *

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL.

- QA Action: Qualify Cr⁺⁶ results in I042_3.5 and 107_REP012811-1 as estimated, 'J', due to collocated sample precision in exceedance of guidance threshold. Bias direction is indeterminate.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: PPG – Site 107, Laboratory Job No. 460-22638-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Site 107

Fractions

Hexavalent chromium (Cr⁺⁶)

Total Metals (Cr, Ni, Sb, Tl, V)

pH / Eh ; ORP

Laboratory: TestAmerica Laboratories, Inc.

Report No.: 460-22638-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.
487 Shoddy Hollow Road
Middletown, New York 10940

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Sample ID	Lab ID	Matrix	Date Collected	Analysis

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 46

Bold Type indicates sample taken as a Batch QC sample

All samples were received on the same day as collected. Samples were received on ice at recorded temperature of 2.4°C.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, duplicate precision, and matrix and post-spike recoveries. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr⁺⁶ was not detected in Field Blank FB-1.

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The recovery for antimony (Sb) in the matrix spike of sample 107_K044_7.5 (Lab ID# 460-22638-20) was below the lower limit of 75%, at 49%. The associated LCS recoveries for Sb were within acceptable limits, indicating analytical process control.

- QA Action: Qualify Sb results in associated field samples (460-22638-17-30, 32-35 and 6-7) as estimated values 'UJ' or 'J', with indication of low bias due to matrix effects.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported, with acceptable precision shown; however, for Sb, none of the reported results were above the minimum threshold values for meaningful precision interpretation. Therefore, the indication of low bias for associated Sb results based on matrix spike recovery is maintained.

No positive element results were reported for the field blank sample (FB-1).

SECTION E pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges; refer to the data usability section above.

SECTION F COLLOCATED SAMPLES

Sample 107_REP013111-1 was identified as being collocated with sample 107_K046_3.5. Precision results are tabulated below.

Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	K046_3.5	R013111-1	%RPD *
Chromium	32.3	31.4	2.8
Nickel	35.9	66.6	30.7 *
Antimony	ND	3.9	3.9 *
Thallium	ND	ND	nc
Vanadium	147	165	11.5
Cr (VI)	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL.

- QA Action: Qualify Ni results in K046_3.5 and 107_REP013111-1 as estimated, 'J', due to collocated sample precision in exceedance of guidance threshold. Bias direction is indeterminate.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 24

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day following collection. Samples were received on ice at recorded temperature of 2.1 °C, in good condition.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, duplicate precision, and matrix and post-spike recoveries. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr⁺⁶ was not detected in Field Blank FB-1.

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, LCS recoveries and serial dilution sample precision, *with the exceptions detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The recoveries for chromium (Cr) and vanadium (V) in the matrix spike of sample 460-22948-9 were reported below the lower limit of 75%, at 66% and 66%, respectively. The associated LCS recoveries for Cr and V were within acceptable limits, indicating analytical process control. *It is noted that this batch spike sample was not from this SDG's samples, but was from this site, and thus may be considered as representative of this SDG's sample matrix characteristics.*

- QA Action: Qualify Cr and V results in associated field samples (460-22912-14 through -22) as estimated values 'UJ' or 'J', with indication of low bias due to matrix effects.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported ; however, for Cr and V, none of the reported results were above the minimum threshold values for meaningful precision interpretation. Therefore, the indication of low bias for associated Cr and V results based on matrix spike recovery is maintained.

No positive element results were reported for the field blank sample (FB-1).

SECTION E pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

No collocated samples were identified for this SDG.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Sites 107 & 108

Fractions

Hexavalent chromium (Cr⁺⁶)
Total Metals (Cr, Ni, Sb, Tl, V)
pH / Eh ; ORP

Laboratory: TestAmerica Laboratories, Inc.

Report No.: 460-22930-1

Matrix: Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.
487 Shoddy Hollow Road
Middletown, New York 10940

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 method 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3010A and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Site ID	Sample ID	Lab ID 460-22930-	Matrix	Date Collected	Analysis	
					Hex Cr	Metals
108_	TMW-J008	1	A	02/09/11	X	X
107_	TMW-K034	2	A	02/09/11	X	X
107_	TMW-M046	3	A	02/09/11	X	X
108_	TMW-J014	4	A	02/09/11	X	X
108_	TMW-D012	5	A	02/09/11	X	X
107_	TMWI042	6	A	02/09/11	X	X
108_	DUP-020911	7	A	02/09/11	X	X
---	FB020911	8FB	A	02/09/11	X	X

A = Aqueous Matrix

Total Samples = 8

All samples were received on the same day of collection. Samples were received on ice at recorded temperature of 0.4°C.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination.

Reported spike recoveries, duplicate precision values, and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

The concentration of Cr⁺⁶ added to the matrix spike was not as specified in the method (7196A, Sect. 7.3.1): "... The amount of spike added should double the concentration found in the original aliquot. Under no circumstances should the increase be less than 30 ug Cr(VI)/liter. ...".

- QA Action: Qualify all reported Cr+6 results as estimated "UJ"; potential bias magnitude and direction is indeterminate.

No positive Cr⁺⁶ result was reported for the field blank sample (FB020911).

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: ICP-MS tune, mass calibration and resolution checks, initial calibration linearity, CRQL sensitivity check, continuing calibration frequency and accuracy, internal standard recoveries, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported spike recoveries and duplicate precision values were randomly verified from the raw data with no disparities between reported and calculated results found.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference.

Results for chromium (Cr), nickel (Ni) and vanadium (V) in sample 460-22930-3 (107-TMW-M046) were reported from a 20x dilution re-analysis, due to exceedance of the linear calibration range for these elements. All other target elements in this sample and all target elements in all other SDG samples were reported from initial 5x dilution runs.

No positive element results were reported for the field blank sample (FB020911).

SECTION E pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

SECTION F COLLOCATED SAMPLES

DUP020911-1 was identified as being collocated with 108_TMW_I042 (460-22930-6). Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	TMW_I042	D020911-1	%RPD
Chromium	4.1 J	4.4 J	0.30 *
Nickel	161	169	4.8
Antimony	ND	ND	nc
Thallium	ND	ND	nc
Vanadium	6.2	6.8	0.60 *
Cr (VI)	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >20%, <100% RPD for aqueous samples >5x CRQL values, and difference >±CRQL, <2x±CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

Dresdner-Robin

Mr. Douglas Neumann

06 June, 2011

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 43

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day after collection. Samples were received on ice at recorded temperatures of 4.0°C.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr⁺⁶ was not detected in Field Blank FB-1.

Matrix spike recoveries for soluble and insoluble Cr⁺⁶ in sample 460-22948-39 (107_M040_3.5) were below the allowable limit of 75% in both initial and re-analyses, with recoveries below 50%, as tabulated below.

Sample ID	Sol.Recov.	Insol.Recov.
22948-39	23%	38%
re-analysis	33%	57%

- QA Action: Qualify Cr⁺⁶ results in batch samples associated with 460-22948-39 (samples 29 – 43) as rejected, 'R', per NJDEP SOP No. 5.A.10, Rev.3, Sect. VI.(D).7.D.8)e). See Data Usability comments below.

- **Data Usability:** Eh / pH results were evaluated to determine ReDox characteristics of batch samples as an indicator of ability to support Cr⁺⁶. The following associated batch samples were characterized as “Reducing” based upon the Method 3060A, Table 2 phase diagram: 460-22948- 30, -31, -36, -37, -38, -39, -40, -42 and -43; these samples are not likely to support the presence of Cr⁺⁶, or if positive, may be low-biased.

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The recoveries for chromium (Cr) and vanadium (V) in the matrix spike of sample 108_D012_11.0 (Lab ID# 460-22948-9) were below the limit of 75%, at 66% and 66%. The associated LCS recoveries for Cr and V were within acceptable limits, indicating analytical process control.

- **QA Action:** Qualify Cr and V results in associated samples 460-22948-1 through -9 (inclusive) as estimated, ‘UJ’ or ‘J’, with indication of low bias due to sample matrix effects.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported, with acceptable precision shown.

No positive element results were reported for the field blank sample (FB-1).

SECTION E pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a ‘field-performed’ analysis. The laboratory assigned all reported pH results an ‘HF’ qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light’s solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample spike recoveries are outside acceptable recovery ranges; refer to the data usability section above.

SECTION F
COLLOCATED SAMPLES

107_REP020911-1 was identified as being collocated with 107_M036_3.5 (460-22948-14). Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	M036_3.5	R020911-1	%RPD
Chromium	58.9	60.2	2.2
Nickel	29.2	34.5	5.3 *
Antimony	2.2	1.0	1.2 *
Thallium	ND	ND	nc
Vanadium	102	71.8	34.8
Cr (VI)	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: PPG – Site 107, Laboratory Job No. 460-22995-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Site 107

Fractions

Hexavalent chromium (Cr⁺⁶)

Total Metals (Cr, Ni, Sb, Tl, V)

pH / Eh ; ORP

Laboratory: TestAmerica Laboratories, Inc.

Report No.: 460-22995-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.
487 Shoddy Hollow Road
Middletown, New York 10940

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 40

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day following collection. Samples were received on ice at recorded temperature of 2.6 °C, in good condition.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, duplicate precision, and matrix and post-spike recoveries. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr⁺⁶ was reported positive in Field Blank FB-021011, at 1.9 J ug/L, which is equivalent to 0.076 mg/Kg (nominal). The following samples exhibited positive results which were $>3x$ but $<10x$ the field blank result: 460-22995- 4, -6, -19 and -31.

- QA Action: Qualify Cr⁺⁶ results in above-noted samples as estimated, 'J', with indication of high bias due to field blank contamination.

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike and LCS recoveries and serial dilution sample precision, *with the exceptions detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The precision (RPD) value for chromium (Cr) between lab replicates of sample 460-22995-22 was reported above the limit of 20%, at 29%.

- QA Action: Qualify Cr results in associated field samples (460-22995-6 through -25) as estimated values 'J', with indeterminate bias direction.

It is noted that no post-digestion spike samples were reported for this delivery group.

No positive element results were reported for the field blank sample (FB-021011).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

Sample REP-021011-1 was not identified with a corresponding collocated field sample.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 30

Bold Type indicates sample taken as a Batch QC sample

All samples were received on the same day of collection. Samples were received on ice at recorded temperature of 3.2°C.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were re-analyzed at dilution in order to bring absorbance values into calibrated range; reported RL values were adjusted based on dilution used.

Cr^{+6} was not detected in Field Blank FB021111.

SECTION D
Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The recovery for antimony in the matrix spike of sample 108_I018_4.5 (Lab ID# 460-23018-23) was below the limit of 75%, at 62%. The associated LCS recoveries for Sb were within acceptable limits, indicating analytical process control.

- QA Action: Qualify Sb results in associated samples 460-23018-23 through -30 (inclusive) as estimated, 'UJ' or 'J', with indication of low bias due to sample matrix effects.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference.

No positive element results were reported for the field blank sample (FB-1).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges.

SECTION F COLLOCATED SAMPLES

REP021111-1, -2 and -3 were identified as being collocated with 107_M020_7.5, 108_K018_8.5, and 108_G018_3.5 (460-23018-13, -20 and -27), respectively. Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	M020_7.5	R021111-1	%RPD	K018_8.5	R021111-2	%RPD	G018_3.5	R021111-3	%RPD
Chromium	21.6	24.5	12.6	14.3	13.6	5.0	16.7	15.5	7.5
Nickel	12.0	12.5	0.5 *	13.7	12.5	1.2 *	17.9	16.6	1.3 *
Antimony	ND	ND	nc	ND	ND	nc	ND	ND	nc
Thallium	ND	ND	nc	ND	ND	nc	ND	ND	nc
Vanadium	17.4	18.7	1.3 *	20.8	19.7	1.1 *	23.0	20.7	2.3 *
Cr (VI)	1.2 J	1.2 J	0	ND	ND	nc	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: PPG – Site 107, Laboratory Job No. 460-23077-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Site 107

Fractions

Hexavalent chromium (Cr⁺⁶)
Total Metals (Cr, Ni, Sb, Tl, V)
pH / Eh ; ORP

Laboratory: TestAmerica Laboratories, Inc.

Report No.: 460-23077-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.

Middletown, New York 10940

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Sample ID 107_	Lab ID 460-23077-	Matrix	Date Collected	Analysis

S = Non-Aqueous Matrix
A = Aqueous Matrix

Total Samples = 38
Bold Type indicates sample taken as a Batch QC sample

All samples were received one day following collection. Samples were received on ice at recorded temperature of 2.7°C.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were re-analyzed at dilution in order to bring absorbance values into calibrated range; reported RL values were adjusted based on dilution used.

Cr⁺⁶ was not detected in Field Blank FB021411.

SECTION D
Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

The recoveries for antimony in the matrix spikes of samples 108_I018_4.5 (Lab ID# 460-23018-23) and 107_E027_15.5 (460-23077-26) were below the limit of 75%, at 62% and 73%, respectively. The associated LCS recoveries for Sb were within acceptable limits, indicating analytical process control.

- QA Action: Qualify Sb results in associated samples 460-23077- 1 through -3 and -15 through -34 (inclusive) as estimated, 'UJ' or 'J', with indication of low bias due to sample matrix effects.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference.

No positive element results were reported for the field blank sample (FB-1).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

REP021411-1, -2 and -3 were identified as being collocated with 107_E031_3.5, E031_15.5, and E027_2.5 (460-23077-2, -5 and -23), respectively. Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	E031_3.5	R021411-1	%RPD	E031_15.5	R021411-2	%RPD	E027_2.5	R021411-3	%RPD
Chromium	18.6	19.6	5.2	15.0	16.6	10.1	116	110	5.3
Nickel	49.9	53.4	6.8	18.3	24.8	6.5 *	17.0	18.3	1.3 *
Antimony	ND	ND	nc	ND	ND	nc	ND	ND	nc
Thallium	ND	ND	nc	ND	ND	nc	ND	ND	nc
Vanadium	19.8	19.9	0.1 *	20.1	25.1	5.0 *	55.6	55.3	0.3 *
Cr (VI)	ND	ND	nc	ND	ND	nc	1.0 J	1.7 J	0.7 *

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 31

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day from collection. Samples were received on ice at recorded temperature of 3.3°C.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr^{+6} was not detected in Field Blank FB021511.

SECTION D
Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Samples 460-23116-12 through -29 and -31 exhibited incorrectly reported Result, RL, MDL and Units values, as raw concentration values in mg/L, rather than as mg/Kg dry-weight values. Therefore, the reported values are under-reported by a nominal factor of 50x in both the laboratory report and the associated EDD results summary.

- **QA Action:** Reported results for associated samples 460-23116-12 through -29 and -31 were re-calculated by the reviewer and reported to client. The laboratory was contacted and requested to determine and resolve the cause of the erroneous values via corrective action process, and to correct and re-issue the affected report sections.
 - *Post-Script:* The laboratory re-digested and re-analyzed the affected samples noted above on 06/08/11, and submitted a revised report including the re-analysis results and associated batch calibrations and QC samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision, *with the exception detailed below*. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) were randomly verified from the raw data with no disparities between reported and calculated results found. Exception: see QA Action above.

The recovery for antimony in the matrix spike of sample 108_F014_9.5 (Lab ID# 460-23166-10) was below the limit of 75%, at 67%. The associated LCS recovery for Sb was within acceptable limits, indicating analytical process control.

The recovery for antimony in the matrix spike of sample 108_E018_2.5 (Lab ID# 460-23166-12) was below the limit of 75%, at 26%. The associated LCS recovery for Sb was within acceptable limits, indicating analytical process control.

- QA Action: Qualify Sb results in associated samples 460-23116-1 through -11 (inclusive) as estimated, 'UJ' or 'J', with indication of low bias due to sample matrix effects.
- QA Action: *Qualify Sb results in associated samples 460-23116-12 through -29 (inclusive) and -31 as estimated, 'UJ' or 'J', with indication of low bias due to sample matrix effects.*

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference.

No positive element results were reported for the field blank sample (FB021511).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

REP021511-1, -2 and -3 were identified as being collocated with 108_D014_0.0, 108_F014_9.5, and 108_E018_2.5 (460-23116-1, -10 and -12), respectively. Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	D014_0.0	R021511-1	%RPD	F014_9.5	R021511-2	%RPD	E018_2.5	R021511-3	%RPD
Chromium	24.8	22.7	8.8	15.1	17.0	11.6	18.9	15.9	17.2
Nickel	15.8	14.0	1.8 *	10.8	11.5	0.7 *	13.7	13.5	0.20 *
Antimony	ND	ND	nc	ND	ND	nc	ND	ND	nc
Thallium	ND	ND	nc	ND	ND	nc	ND	ND	nc
Vanadium	30.5	36.4	4.9 *	16.4	20.8	4.4 *	23.5	20.4	3.1 *
Cr (VI)	ND	ND	nc	ND	ND	nc	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

NB - The Total Metals samples re-analyzed on 06/08/11 exhibited concentrations which differed from the original reported results (as calculated from the raw data by the reviewer) by a relatively wide margin; the newer results were typically lower than those originally reported. Since there were no significant QC or analytical process anomalies noted in the original data (with the exception of incorrect final reporting, as discussed above), a conservative approach would suggest utilization of the original data (as correctly revised, reported and qualified) for regulatory compliance purposes.

Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination.

Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

No positive Cr⁺⁶ result was reported for the field blank sample (FB022311).

SECTION D
Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported spike recoveries, duplicate precision values, reported % moisture (% solids) were randomly verified from the raw data with no disparities between reported and calculated results found.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference.

No positive element results were reported for the field blank sample (FB022311).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

REP022311-1 and -2 were identified as being collocated with 107_D019_8.0 and 108_M018_12.0 (460-23391-3 and -8), respectively. Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	D019_8.0	R022311-1	%RPD	M018_12.0	R022311-2	%RPD
Chromium	20.7	23.9	14.3	12.7	15.9	22.4
Nickel	14.0	13.7	0.3 *	10.5	12.2	1.7 *
Antimony	ND	ND	nc	ND	ND	nc
Thallium	ND	ND	nc	ND	ND	nc
Vanadium	29.4	32.9	3.5 *	18.3	20.1	1.8 *
Cr (VI)	ND	4.6	4.6 *	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: PPG – Sites 107 & 108, Laboratory Job No. 460-23410-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Sites 107 & 108

Fractions

Hexavalent chromium (Cr⁺⁶)
Total Metals (Cr, Ni, Sb, Tl, V)
pH / Eh ; ORP

Laboratory: TestAmerica Laboratories, Inc.

Report No.: 460-23410-1

Matrix: Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.
487 Shoddy Hollow Road
Middletown, New York 10940

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 method 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3010A and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Site ID	Sample ID	Lab ID 460-23410-	Matrix	Date Collected	Analysis	
					Hex Cr	Metals
107_	TMW-D019	1	A	02/24/11	X	X
108_	TMW-M018	2	A	02/24/11	X	X
108_	DUP	3	A	02/24/11	X	X
	Field Blank	4	A	02/24/11	X	X
108_	TMW-M006	5	A	02/24/11	X	X
108_	TMW-B008	6	A	02/24/11	X	X
108_	TMW-C002	7	A	02/24/11	X	X

A = Aqueous Matrix

Total Samples = 7

All samples were received on the same day of collection. Samples were received on ice at recorded temperature of 1.1°C.

SECTION C Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix) were met for all samples. Samples 108-TMW- M006, -B008 and -C002 were analyzed at 2x, 5x and 2x dilutions, respectively, due to interferences present in the samples. These samples were reported with appropriate RL elevations.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks were free of contamination.

Reported spike recoveries, duplicate precision values, and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

The concentration of Cr⁺⁶ added to the matrix spike was not as specified in the method (7196A, Sect. 7.3.1): "... The amount of spike added should double the concentration found in the original aliquot. Under no circumstances should the increase be less than 30 ug Cr(VI)/liter. ...".

- QA Action: Qualify all reported Cr+6 results as estimated "UJ" or "J"; potential bias magnitude and direction is indeterminate.

No positive Cr⁺⁶ result was reported for the field blank sample.

SECTION D Total Metals

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: ICP-MS tune, mass calibration and resolution checks, initial calibration linearity, CRQL sensitivity check, continuing calibration frequency and accuracy, internal standard recoveries, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported spike recoveries and duplicate precision values were randomly verified from the raw data with no disparities between reported and calculated results found.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference.

All target elements in all samples were reported from initial 5x dilution runs.

No positive element results were reported for the field blank sample.

SECTION E pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

SECTION F COLLOCATED SAMPLES

DUP (022411) was identified as being collocated with 108_TMW_M018 (460-23410-2). Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	TMW_M018	D022411	%RPD
Chromium	242	217	10.9
Nickel	17.1	16.3	0.80 *
Antimony	4.1	3.8	0.30 *
Thallium	ND	ND	nc
Vanadium	16.8	15.3	1.5 *
Cr (VI)	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >20%, <100% RPD for aqueous samples >5x CRQL values, and difference >±CRQL, <2x±CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

Dresdner-Robin

Mr. Douglas Neumann

S = Non-Aqueous Matrix
A = Aqueous Matrix

Total Samples = 50

NR = not reported

Bold Type indicates sample taken as a Batch QC sample

All samples were received one day from collection. Samples were received on ice at recorded temperature of 2.1°C.

SECTION C
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination.

Reported spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Cr⁺⁶ was reported positive for the field blank sample (FB060611) at 1.7 J ug/L, and in the associated aqueous method blank at 2.9 ug/L. Per NJDEP guidance, an aqueous prep blank is not required for the field blank if only soil samples are analyzed. It is the reviewer's opinion that the reported field blank contamination is due to the associated prep blank, and since the associated soil samples method blanks were free of contamination, no QA action is necessary.

SECTION D
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. Since the samples were chilled on receipt at the lab, and analyzed within one day of receipt, no data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly

verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample spike recoveries are outside acceptable recovery ranges.

SECTION E
COLLOCATED SAMPLES

REP060611-1, -2 and -3 were identified as being collocated with (107_) I038E_7.0, J038-11.0 and I037_12.0, respectively. Precision results (as %RPD) are tabulated below. Note: ND = Not Detected ; nc = not calculated ; NR = Not Reported ; * = absolute difference is shown if either sample <5x CRQL

	I038E 7.0	R60611-1	%RPD	J038 11.0	R60611-2	%RPD	I037 12.0	R60611-3	%RPD
Cr (VI)	2.4	0.96	1.4 *	NR	2.4 U	nc	2.4 U	2.4 U	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: PPG – Site 107, Laboratory Job No. 460-27429-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Site 107

Fractions

Hexavalent chromium (Cr⁺⁶)

Laboratory: TestAmerica Laboratories, Inc.

Total Vanadium (V)

pH / Eh ; ORP

Report No.: 460-27429-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of ‘Total Samples’ listed below is exclusive of associated QC samples (MS / MD).

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 32

NR = not reported

Bold Type indicates sample taken as a Batch QC sample*Italic type* indicates samples are collocated field duplicates

All samples were received one day from collection. Samples were received on ice at recorded temperature of 2.7°C.

SECTION C
Hexavalent Chromium (Cr⁺⁶)

Holding times from sample collection to analysis (≤ 30 days for non-aqueous matrix) were met for all soil samples. The aqueous field blank (FB060711) was analyzed beyond the allowable holding time of 24 hours, but < 48 hours from collection; the reported result for this sample was flagged as estimated 'UJ', with indication of potential low bias on the reported RL value due to holding time exceedance.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The recovery of Cr⁺⁶ in the Post-Spike of batch QC sample F036_3.5 (460-27429-9) exceeded the upper limit of 115%, at 147%; re-analysis of the re-spiked sample was 144%. The positive results for Cr⁺⁶ in associated batch samples (460-27429-1-9) were flagged as estimated 'J', with indication of high bias due to matrix effects.

SECTION D
Total Metals (V)

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. The reported QC batch parent sample was not from this site's samples and may not be representative of this SDG's sample matrix characteristics, and were not considered for qualification. Reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference. No positive element results were reported for the field blank sample (FB060711).

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

REP060711-1 and -2 were identified as being collocated with 107_G036E_6.0 and 107_G035_5.0, respectively. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL.

	REP060711-1	G036E_6.0	%RPD	REP060711-1	G035_5.0	%RPD
Cr (VI)	4.3	6.5	2.2*	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of ‘Total Samples’ listed below is exclusive of associated QC samples (MS / MD).

Sample ID 107_-	Lab ID 460-27475-	Matrix	Date Collected	Analysis	
				Hex. Cr	Metals (V)

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 21

Bold Type indicates sample taken as a Batch QC sample

Italic type indicates samples are collocated field duplicates

All samples were received one day from collection. Samples were received on ice at recorded temperature of -0.2°C. No sample condition issues were noted in the sample receipt log ; no QA action was taken.

SECTION C

Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr^{+6} results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were analyzed at dilution volumes due to Cr^{+6} concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The recovery of Cr^{+6} in the Post-Spike of batch QC sample F040E_5.0 (460-27475-1) exceeded the upper limit of 115%, at 120%; re-analysis of the re-spiked sample recovered within limits at 96%. No data qualifiers were necessary.

The initial matrix spike recovery for soluble Cr^{+6} was low due to the sample native concentration $>4x$ spike-added concentration (246 mg/Kg vs. 43 mg/Kg spiked). The sample was re-spiked and re-analyzed at appropriate concentration (541 mg/Kg) and recovered within limits at 77%. No QA action was necessary. It is noted that the batch QC sample F040E_5.0 (460-27475-1), and all other SDG samples, indicated oxidizing tendency based on measured ORP values. The parent sample was subsequently analyzed for sulfide (S^-), TOC and ferrous iron (Fe^{++}). TOC result was positive (31000 mg/Kg), and S^- and Fe^{++} results were non-detect. It is presumed based on these ancillary results that the soil matrix is of an oxidizing nature that would not tend to inhibit the presence of hexavalent chromium.

SECTION D Total Metals (V)

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. The reported QC batch parent sample was not from this site's samples and may not be representative of this SDG's sample matrix characteristics, and was not considered for qualification. Reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

It is noted that no post-digestion spike samples were reported for this delivery group. Serial dilution samples were reported; no results in these samples exceeded the applicable threshold for calculation of percent difference. No positive element results were reported for the field blank sample (FB060711).

SECTION E pH / Eh (ORP) / Ferrous Iron / Sulfide / TOC

Samples for pH analysis and Fe^{++} were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH and Fe^{++} results an 'HF' qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. All samples were characterized as "Oxidizing" based on ORP plots on the phase diagram. These values are only used for data assessment purposes when Cr^{+6} sample matrix spike recoveries are outside acceptable recovery ranges.

Matrix spike recoveries for sulfide and ferrous iron were below the respective lower acceptance limits of 90% and 81%, at 13% and 1%. LCS recoveries were within limits for these analytes, indicating acceptable analytical process control. Reported results for sulfide and ferrous iron in parent sample F040E_5.0 (460-27475-1) were flagged as estimated RL values (UJ), with indication of low bias due to sample matrix effects. Repeat analyses confirmed the original low recoveries.

SECTION F
COLLOCATED SAMPLES

REP060811-1 was identified as being collocated with 107_F040S_3.5. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL

	REP060811-1	F040S_3.5	%RPD
Vanadium	18.7	17.9	0.8*
Cr (VI)	ND	ND	nc

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,

Re: PPG – Site 108, Laboratory Job No. 460-27543-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Site 108

Fractions

Hexavalent chromium (Cr⁺⁶)

Laboratory: TestAmerica Laboratories, Inc.

pH / Eh ; ORP

Report No.: 460-27543-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr⁺⁶) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples (if requested) were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the HCrO₄⁻ / Cr(OH)₃ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively.

A summary table of samples analyzed is presented below. Please note that the number of ‘Total Samples’ listed below is exclusive of associated QC samples (MS / MD).

Sample ID: 108_	Laboratory ID: 460-27543-	Matrix	Date Collected	Analysis Hex. Cr
M018_E	1	S	06/10/11	X
M018_S	2	S	06/10/11	X
<i>M018_W</i>	3	S	06/10/11	X
M018_N	4	S	06/10/11	X
<i>REP_061011-1</i>	5	S	06/10/11	X
FB061011	6FB	A	06/10/11	X

S = Non-Aqueous Matrix
A = Aqueous Matrix

Total Samples = 6

NR = not reported

Bold Type indicates sample taken as a Batch QC sample

Italic type indicates samples are collocated field duplicates

All samples were received on the same day as collection. Samples were received on ice at recorded temperature of 6.0°C. The chain-of-custody indicated appropriate chemical preservation. The sample receipt log (p. 189) indicated that no custody seal was present on the sample cooler. No action was taken; however, the data users should incorporate this information into their overall assessment of data utility.

SECTION C Hexavalent Chromium (Cr⁺⁶)

Holding times from sample collection to analysis (≤ 30 days for non-aqueous matrix; < 24 hours for aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

Soluble and insoluble Cr⁺⁶ spike recoveries in batch QC sample 108-M018_E (Lab ID: 460-27543-1) were below the allowable limit of 75% (at 1% and 12%, respectively); sample re-digestion and re-analysis was subsequently performed on all samples, with the original QC batch parent sample presenting recoveries comparable to the initial results. The post-verification spike recoveries were below the allowable limit of 85% (at 30% and 37%). The associated LCS recoveries for Cr⁺⁶ were within acceptable limits, indicating analytical process control.

- QA Action: Reported Cr⁺⁶ results in all soil samples are rejected, 'R', per the guidance contained in NJDEP, SOP No. 5.A.10, Rev. 3, Sect. VI.(D)7.D.8)e).

The data user is referred to the attached Cr⁺⁶ report and Data Usability comments below.

- Data Usability:
 - 1) Eh / pH results were evaluated to determine ReDox characteristics of batch samples as an indicator of ability to support Cr⁺⁶. Numerous batch samples including the spike parent were characterized as “Reducing” based upon the Method 3060A, Table 2 phase diagram; these samples are not expected to support the presence of Cr⁺⁶, or if positive, may be low-biased.
 - 2) Sulfide screen, ferrous iron and TOC analyses were performed on the batch QC parent sample in order to provide further information regarding sample matrix ReDox characteristics.

SECTION E
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a ‘field-performed’ analysis. The laboratory assigned all reported pH results an ‘HF’ qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light’s solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION F
COLLOCATED SAMPLES

REP061011-1 was identified as being collocated with 108_M018_W. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL.

	REP061011-1	M018_W	%RPD
Cr (VI)	11.9	8.8	3.1*

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION G

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 6

NR = not reported

Bold Type indicates sample taken as a Batch QC sample*Italic type* indicates samples are collocated field duplicates

All samples were received on the same day as collection. Samples were received on ice at recorded temperature of 3.5°C. The chain-of-custody indicated appropriate chemical preservation. The sample receipt log (p. 124) did not indicate the presence of a custody seal on the sample cooler. No action was taken; however, the data users should incorporate this information into their overall assessment of data utility.

SECTION C

Hexavalent Chromium (Cr⁺⁶)

Holding times from sample collection to analysis (≤ 30 days for non-aqueous matrix; < 24 hours for aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found.

The precision value (expressed as RPD) for sample 108_M018_N_2.0 (Lab ID: 460-27904-3) and its laboratory replicate exceeded the method limit of 20 (at 33).

- QA Action: Reported positive Cr⁺⁶ results in soil samples are flagged as estimated 'J', with indeterminate bias direction.

SECTION D

pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION E
COLLOCATED SAMPLES

REP062111-1 was identified as being collocated with 108_M018_E_2.5. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL.

	REP062111-1	M018_E_2.5	%RPD
Cr (VI)	6.9	6.0	0.9*

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

FB070111	3FB	A	07/01/11	X

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 3

NR = not reported

Bold Type indicates sample taken as a Batch QC sample*Italic type* indicates samples are collocated field duplicates

All samples were received on the same day as collection. Samples were received on ice at recorded temperature of 1.5°C. The chain-of-custody indicated appropriate chemical preservation. The sample receipt log (p. 124) did not indicate the presence of a custody seal on the sample cooler. No action was taken; however, the data users should incorporate this information into their overall assessment of data utility.

SECTION C

Hexavalent Chromium (Cr⁺⁶)

Holding times from sample collection to analysis (≤ 30 days for non-aqueous matrix; < 24 hours for aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Soil samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The recovery of Cr⁺⁶ in the Post-Spike of batch QC sample M018_N_070111 (460-28340-1) exceeded the upper limit of 115%, at 117%; re-analysis of the re-spiked sample recovered within limits at 114%.

The recovery of Cr⁺⁶ in the soluble matrix pike of batch QC sample M018_N_070111 (460-28340-1) exceeded the upper limit of 125%, at 132%; this may be due to the native sample concentration being $> 4x$ the spike added. The sample was re-digested and re-spiked at appropriate concentration; re-analysis of the re-spiked sample recovered within limits at 93%. No data qualifiers were necessary. Since the re-digested, re-analyzed results are associated with compliant QC batch results, the reviewer suggests use of these re-analysis results.

SECTION D

pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION E
COLLOCATED SAMPLES

REP070111-1 was identified as being collocated with 108_M018_N_070111. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL.

	REP070111	M018_N_070111	%RPD
Cr (VI)	256	306	17.8

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

Re: PPG – Site 107, Laboratory Job No. 460-29983-1

Dear Mr. Neumann,

This cover letter, and the attached documents, detail the data validation findings associated with the following sample analytical results contained in the above-referenced deliverables set:

Site Name: PPG – Site 107

Fractions

Hexavalent chromium (Cr^{+6})
pH / Eh ; ORP

Laboratory: TestAmerica Laboratories, Inc.

Report No.: 460-29983-1

Matrix: Non-Aqueous

Reviewer: Chris Taylor

Prepared By: Environmental Quality Associates, Inc.

SECTION A
Sample Information

The above-noted laboratory Job Number samples were analyzed by TestAmerica Laboratories, Inc., Edison, NJ (NJ Laboratory ID Cert. No. 12028). Hexavalent chromium (Cr^{+6}) samples were prepared and analyzed using USEPA SW-846 methods 3060A and 7196A. Total metals samples (if requested) were prepared and analyzed using USEPA SW-846 methods 3050B (3010A for aqueous samples) and 6010B. Oxidation / Reduction Potential (ORP) characteristics were determined by measurement of pH / Eh values for samples and subsequent extrapolation against the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; pH and Eh values were measured by Standard Methods 4500H-B and 2580B, respectively. It is noted that the phase diagram plots for several SDG samples were not found in the deliverables; these were requested from the laboratory and received on 01/30/12.

A summary table of samples analyzed is presented below. Please note that the number of 'Total Samples' listed below is exclusive of associated QC samples (MS / MD).

Sample ID: 107_	Laboratory ID: 460-29983-	Matrix	Date Collected	Analysis Hex. Cr

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 28

NR = not reported

Bold Type indicates sample taken as a Batch QC sample

Italic type indicates samples are collocated field duplicates

All samples were received one day following collection. Samples were received on ice at recorded temperature of 2.7°C. The chain-of-custody indicated appropriate chemical preservation. The sample receipt log (p. 330) did not indicate the presence of a custody seal on the sample cooler. No action was taken; however, the data users should incorporate this information into their overall assessment of data utility.

SECTION C
Hexavalent Chromium (Cr⁺⁶)

Holding times from sample collection to analysis (≤ 30 days for non-aqueous matrix; < 24 hours for aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Some samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

Soil samples in this SDG were extracted and analyzed in three separate QC batches; sample F039W_8.5 (Lab ID: 460-29983-12) and eight associated samples (460-29983-4-6, 8-11 and 31) were included in the SDG sample QC batch. Although the remainder of the SDG soils associated QC batch results were reported within acceptable limits, the parent QC batch samples were not from this site and may not be representative of this SDG's / site's matrix characteristics. No data validation qualifiers were assigned.

SECTION D
pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr⁺⁶ sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION E
COLLOCATED SAMPLES

REP081511-1 and REP081511-1 were identified as being collocated with F038_5.0 and F038_6.5, respectively. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample $< 5x$ CRQL.

	REP081511-1	F038_5.0	%RPD	REP081511-2	F038_6.5	%RPD
Cr (VI)	16.9	22.1	27	3.0	2.8	0.2*

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action is necessary based on the above field duplicate precision results.

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

FB081611	62FB	A	08/16/11	X

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 45

NR = not reported

Bold Type indicates sample taken as a Batch QC sample*Italic type* indicates samples are collocated field duplicates

All samples were received one day following collection. Samples were received on ice at recorded temperatures of 2.4 and 3.1°C. The chain-of-custody indicated appropriate chemical preservation. The sample receipt log (p. 502) did not indicate the presence of a custody seal on the sample cooler. No action was taken; however, the data users should incorporate this information into their overall assessment of data utility.

SECTION C

Hexavalent Chromium (Cr⁺⁶)

Holding times from sample collection to analysis (≤ 30 days for non-aqueous matrix; < 24 hours for aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Some samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

Soil samples in this SDG were extracted and analyzed in four separate QC batches; samples 107_H037_5.0 (Lab ID: 460-30033-17) and 108_M018_A_4.0 (Lab ID: 460-30033-34) and associated samples were included in the SDG samples QC batches. The soluble matrix spike recoveries for 107_H037_5.0 were below 50% in both the initial and redigested analyses (42%; 38%); the insoluble and post-spike recoveries were within limits.

- QA Action: Reported Cr⁺⁶ results in soil samples 30033-(4-10), 12, (17-19) and 21 are flagged estimated, "UJ" or 'J', with indication of low bias due to sample matrix effects.

Although the remainder of the SDG soils associated QC batch results were reported within acceptable limits, the parent QC batch samples were not from this site and may not be representative of this SDG's / site's matrix characteristics. No other data validation qualifiers for Cr⁺⁶ were necessary.

SECTION D

pH / Eh (ORP)

Samples for pH analysis were analyzed outside the method-defined holding-time of 15 minutes, which is essentially a 'field-performed' analysis. The laboratory assigned all reported pH results an 'HF' qualifier flag to indicate this exception. No data validation qualifiers were assigned.

Calibrations for pH analysis were acceptable, as were required QC criteria (sample duplicates). Standard mV solution checks for Eh (Light's solution) were within acceptable ranges, as were sample duplicate measurements.

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the $\text{HCrO}_4^- / \text{Cr}(\text{OH})_3$ phase diagram; no disparities relative to reported values and characteristics were found. These values are only used for data assessment purposes when Cr^{+6} sample matrix spike recoveries are outside acceptable recovery ranges.

SECTION E
COLLOCATED SAMPLES

REP081611-1, -2 and -3 were identified as being collocated with 107_G037N_5.0, 107_E036_3.5 and 108_M018A_2.5, respectively. Precision results are tabulated below. Note: ND = Not Detected ; nc = not calculated ; * = absolute difference is shown if either sample <5x CRQL.

	REP-1	G037N_5.0	%RPD	REP-2	E036_3.5	%RPD	REP-3	M018A_2.5	%RPD
Cr (VI)	40.9	40.4	1.2	35.9	39.5	9.5	9.1	9140	##

The disparity between Rep-3 and parent results indicates possible sample mis-identification. No action was taken based on these disparate results.

The NJDEP DV guidance protocols do not provide qualification thresholds for field duplicate precision values; however, EPA Region II data validation guidance (SOP No. HW-2, Rev. 13, Sept. 2006) provides for a qualification range of >35%, <120% RPD for soils >5x CRQL values, and difference >2x CRQL if either sample is <5x CRQL. No QA action was taken based on the above field duplicate precision results.

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

S = Non-Aqueous Matrix

A = Aqueous Matrix

Total Samples = 47 (Cr+6) ; 26 (V) ; 3 (Sb)

Bold Type indicates sample taken as a Batch QC sample

Italic type indicates samples are collocated field duplicates

All samples were received one day from collection. Samples were received on ice at recorded temperature of 4°C. No sample condition issues were noted in the sample receipt log.

SECTION B
Hexavalent Chromium

Holding times from sample collection to analysis (≤ 24 hours for aqueous matrix; ≤ 30 days for non-aqueous matrix) were met for all samples.

All calibration criteria were met for this sample group, including: initial calibration linearity and continuing calibration frequency and accuracy. Method and calibration blanks for soils were free of contamination. Reported matrix spike recoveries, duplicate precision values, reported % moisture (% solids) and reported Cr⁺⁶ results were randomly verified from the raw data with no disparities between reported and calculated results found. Several samples were analyzed at dilution volumes due to Cr⁺⁶ concentrations above calibrated range; reported RL values were adjusted accordingly for these dilution runs and are noted on the sample result forms.

The soluble spike recoveries of Cr⁺⁶ in batch QC sample E12-06877-068 were below the lower limit of 75%, on initial and re-analysis. Since insoluble recoveries were $>50\%$, the reported results for associated samples (-068, -071) were qualified as estimated 'J' for Cr⁺⁶. The parent sample was subsequently analyzed for ORP, sulfide (S⁻), TOC and ferrous iron (Fe⁺⁺). TOC result was positive (22400 mg/Kg), S⁻ was non-detect and Fe⁺⁺ was below RL value. Based on these ancillary results, it is indicated that the soil matrix is of a reductive nature that would not support the presence of hexavalent chromium.

SECTION C
Total Metals (V, Sb)

Holding times from sample collection to analysis were met for all total metals samples.

Calibration and QC criteria were met for this sample group, including: initial calibration linearity, continuing calibration frequency and accuracy, blanks, interference checks, matrix spike recoveries, duplicate precision, LCS recoveries and serial dilution sample precision. Reported % moisture (% solids) and reported metal results were randomly verified from the raw data with no disparities between reported and calculated results found.

No positive element results were reported for the field blank sample (FB071012).

SECTION D
ReDox Characteristics

Reported pH and eH (ORP) values and resulting ReDox (reducing or oxidizing) characteristics were randomly verified from the HCrO₄⁻ / Cr(OH)₃ phase diagram; no disparities relative to reported values and characteristics were found.

SECTION E
COLLOCATED SAMPLES

The identity of the sample collocated with sample REP071012-4 was not found in the summary table.

SECTION F
Overall Recommendations

The results of the review and validation process for the above analytical fractions and associated samples are summarized on the attached standard-format NJDEP Data Validation Report Forms, in order to facilitate the end-user's' review of these data.

Very truly yours,
Environmental Quality Associates, Inc.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB51380
Sample Date: October 28, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: January 31, 2014

This data validation (DV) report presents the data review and result qualifications for eight (8) soil samples collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on October 28, 2013 for sample delivery group (SDG) JB51380. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB51380 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the eight collected soil samples.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB512380-1 through -8 (inclusive);
- Chromium (ENJ-) in Samples JB512380-1 through -8 (inclusive);
- Nickel (ENJ-) in Samples JB512380-1 through -8 (inclusive);
- Vanadium (ENJ-) in Samples JB512380-1 through -8 (inclusive).

No other sample results in SDG JB51380 required qualification, including hexavalent chromium results, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. All reported concentrations were below the respective site remediation standard (SRS) limits.

The sample results that were subject to qualification following the DV review are presented in Table 4 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The eight (8) soil samples collected October 28, 2013, were received on the same day at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 1°C. The

samples destined for metals analysis were received at the Accutest Laboratories Southeast, Inc. in Orlando, Florida October 30, 2013 preserved and in good condition with sampling cooler temperatures of 3°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
HD002 5-5.5	JB51380-1	10/28/13	Soil	Metals, Cr+6
HD002 5.5-6	JB51380-2	10/28/13	Soil	Metals, Cr+6
HD002 6-6.5	JB51380-3	10/28/13	Soil	Metals, Cr+6
HD002 6.5-7	JB51380-4	10/28/13	Soil	Metals, Cr+6
HD003 4-4.5	JB51380-5	10/28/13	Soil	Metals, Cr+6
HD003 4.5-5	JB51380-6	10/28/13	Soil	Metals, Cr+6
HD003 5-5.5	JB51380-7	10/28/13	Soil	Metals, Cr+6
HD003 5.5-6	JB51380-8	10/28/13	Soil	Metals, Cr+6

Metals – Antimony, total chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories SE in Orlando, FL.
 Cr+6 – Hexavalent chromium (Cr+6) analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ., together with redox potential and pH.

Data Review

Data, as presented in the analytical data package SDG JB51380, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006);
- *NJDEP Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Sample results exhibited concentrations below the respective site remediation standard (SRS) levels in each of the 8 soil samples of this SDG, except nickel (34.1 mg/Kg) in HD002 5-5.5 (JB51380-1).

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony, chromium, nickel and vanadium were identified as being outside QC limits in QC Batch MP26309 indicating possible matrix interference and/or sample non-homogeneity. The case narrative also stated that the RPD(s) for Duplicate for chromium, vanadium, nickel; and RPD(s) for MSD for antimony and thallium are outside control limits due to possible sample non-homogeneity. The RPDs of the serial dilution results for chromium, nickel and vanadium are outside QC limits in QC Batch MP26309 with the probable cause due to sample non-homogeneity. All other QC requirements were met, including analyses for Cr⁺⁶, pH, oxidation reduction potential, and total solids. Details are discussed in the sections below.

However, inspection of the data revealed that the RPD values for the duplicate analysis (chromium, nickel, and vanadium) and the thallium in the duplicate spike analysis were actually below the DV guidelines of 35%RPD, as explained in text below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There was one exception where the 66% antimony recovery in a closing "CRI" recovered below the 70-130% QC limits. However, no soil sample results were affected by this standard because all reporting limits of the non-detect antimony results were above the affected range (True spike value ± CRQL) and thus, no soil sample results were subject to qualification for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks or the continuing calibration blanks at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB51380.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony, chromium, and vanadium were below QC limits of 75 - 125% for QC samples in the non-client QC sample in QC Batch MP26309, as well as the MS recovery for nickel in the MSD sample, which are summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential or low bias in the ability to recover the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). Since there is no minimum spike recovery value for qualifying associated samples, including negative recoveries, the sample results are merely qualified as estimated values and were not rejected. Because detected concentrations of chromium and vanadium were recovered in each of the eight soil samples of this SDG, qualification, and not rejection, of the chromium and vanadium result was judged appropriate and acknowledged by Mr. Joseph Sanguiliano of the NJDEP. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26309 †	FA9475-1	Antimony	17.6 %	8.3 %	NJ-	Low
MP26309 †	FA9475-1	Chromium	-1.8 %	-19.7 %	NJ-	Low
MP26309 †	FA9475-1	Nickel	76.8 %	72.2 %	NJ-	Low
MP26309 †	FA9475-1	Vanadium	-5.1 %	-9.7 %	NJ-	Low
QC Limits are 75-125%; NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. MS – Matrix spike MSD – Matrix spike duplicate. † – The samples associated with QC Batch MP26309 consist of JB51380-1 through -8 (inclusive).						

The antimony, chromium, nickel, and vanadium results in all of these affected samples are flagged with "NJ-" due to a potential low bias. These qualified results are presented below in summary table, Table 4, together with the results qualified for serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on the batch QC sample, as well as a spiked duplicate sample, both from another client with concentrations comparable to PPG samples. All %RPD values were below the DV guidance QC limit of 35%RPD (USEPA, 2010), with values ranging 0-33.9%RPD for soil samples, except for the antimony result in the spiked duplicate sample (non-client sample FA9475-1). Although the difference between the spiked duplicates was 90.9%RPD,

due to the low sample concentration, the QC limit applicable for assessing the precision was 2 × CRQL (2 × 1 mg/Kg), which was exceeded by the difference between the spiked duplicate results of 1.8 and 4.8 mg/Kg. However, because the spike amounts applied to the samples differed by almost twice that amount (5.6 mg/Kg), it was judged appropriate to not qualify the associated results because the values were not comparable. The greater amount recovered in the MSD is likely more attributable to the larger spike, rather than problems in the precision. Consequently, it was judged appropriate to not qualify the associated sample results because the conditions of the spike differed more than the recovered amounts.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 93.1% - 103.0% for the soil sample metals analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the RPD serial dilution results being outside QC limits for chromium, nickel, and vanadium in QC Batch MP26309 and stated that the probable cause for the difference is due to sample non-homogeneity, though the likely cause is attributable to interferences within the sample matrix. Thus, the affected chromium, nickel, and vanadium results in the samples associated with these elevated %D excursions are subject to qualification following the DV review, as discussed below. These QC results are detailed in Table 3 below.

Table 3. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26309 †	FA9475-1	Chromium	15.9 %D	EJ
MP26309 †	FA9475-1	Nickel	13.8 %D	EJ
MP26309 †	FA9475-1	Vanadium	16.1 %D	EJ
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.				
† – The samples associated with this QC Batch consist of JB51380-1 through -8 (inclusive).				

The associated chromium, nickel, and vanadium results in samples with laboratory sample ID numbers ranging JB51380-1 through -8, inclusive, are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 4, along with the results qualified for matrix spike recoveries outside QC limits.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported nickel results:

$$\text{Nickel (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)

V = final volume (mL)
 DF = Dilution factor
 W = wet weight (g)
 TS = Total solids (%)
 1000 = conversion factor (mL/L)

The nickel concentration for Sample HD002 5-5.5 (JB51380-1) was listed as 34.1 mg/Kg on the reporting form and 0.6847 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Nickel (mg/Kg)} = \frac{(684.7 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.09 \text{ g}) (92.1/100\%)} = \frac{34,235}{1003.89} = 34.1023 \mu\text{g/g}$$

$$= 34.1 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 19.5 mg/Kg for Sample HD002 5-5.5 was correctly reported.

Reporting Limits

No samples required dilution, such that all reporting limits were below the respective SRS values.

Summary

The soil sample analytical results for the samples of SDG JB51380 were found to be compliant with the analytical methods for the analysis of metals in the thirty-six soil samples using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries for antimony, chromium, nickel, and vanadium in the QC batch associated with the eight soil samples: JB451380-1 through -8. The antimony, chromium, nickel and vanadium results in these samples are qualified as estimated values (flagged "NJ-") in the associated soil samples due to a potential low bias, as summarized below in Table 4.

The serial dilution results for chromium, nickel, and vanadium in the QC sample of QC Batch MP26309 were above the QC limit of 10.0 %D, suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the identified results are qualified as estimated values and are flagged with "EJ" in the eight samples, as presented below in Table 4.

Table 4. Summary Qualified Sample Metals Results in SDG JB51380

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
HD002 5-5.5	JB51380-1	Antimony	< 2.0	NJ-
HD002 5-5.5	JB51380-1	Chromium	20.0	ENJ-
HD002 5-5.5	JB51380-1	Nickel	34.1	ENJ-
HD002 5-5.5	JB51380-1	Vanadium	13.3	ENJ-
HD002 5.5-6	JB51380-2	Antimony	< 1.5	NJ-
HD002 5.5-6	JB51380-2	Chromium	10.0	ENJ-
HD002 5.5-6	JB51380-2	Nickel	20.6	ENJ-
HD002 5.5-6	JB51380-2	Vanadium	9.4	ENJ-
HD002 6-6.5	JB51380-3	Antimony	< 1.8	NJ-
HD002 6-6.5	JB51380-3	Chromium	12.1	ENJ-
HD002 6-6.5	JB51380-3	Nickel	29.7	ENJ-

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
HD002 6-6.5	JB51380-3	Vanadium	13.2	ENJ-
HD002 6.5-7	JB51380-4	Antimony	< 1.7	NJ-
HD002 6.5-7	JB51380-4	Chromium	10.3	ENJ-
HD002 6.5-7	JB51380-4	Nickel	24.9	ENJ-
HD002 6.5-7	JB51380-4	Vanadium	11.5	ENJ-
HD003 4-4.5	JB51380-5	Antimony	< 2.1	NJ-
HD003 4-4.5	JB51380-5	Chromium	12.0	ENJ-
HD003 4-4.5	JB51380-5	Nickel	10.8	ENJ-
HD003 4-4.5	JB51380-5	Vanadium	16.4	ENJ-
HD003 4.5-5	JB51380-6	Antimony	< 2.2	NJ-
HD003 4.5-5	JB51380-6	Chromium	13.3	ENJ-
HD003 4.5-5	JB51380-6	Nickel	12.4	ENJ-
HD003 4.5-5	JB51380-6	Vanadium	17.2	ENJ-
HD003 5-5.5	JB51380-7	Antimony	< 1.5	NJ-
HD003 5-5.5	JB51380-7	Chromium	16.9	ENJ-
HD003 5-5.5	JB51380-7	Nickel	18.2	ENJ-
HD003 5-5.5	JB51380-7	Vanadium	20.8	ENJ-
HD003 5.5-6	JB51380-8	Antimony	< 5.9	NJ-
HD003 5.5-6	JB51380-8	Chromium	26.6	ENJ-
HD003 5.5-6	JB51380-8	Nickel	17.5	ENJ-
HD003 5.5-6	JB51380-8	Vanadium	28.8	ENJ-

Key:

- < –The analyte was analyzed for, but was not detected above the stated reporting limit.
- N – The matrix spike sample recovery in the associated QC sample is not within QC limits.
- J- – The result is an estimated value, but the result may be biased low.
- EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the eight (8) soil samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ Quantitation checks | √ Data qualifiers |
| √ Data package completeness | |

Hexavalent chromium was detected in five of eight soil samples analyzed in SDG JB51380 with detected concentrations of 1.4 or less, such that no Cr+6 results had exceeded the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient with a value of 0.99992, a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 95.7% to 96.4% for the QC batch associated with the 8 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 5. No hexavalent chromium results required qualification based on the results of the MS recoveries.

Table 5. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP75644	JB51380-1	Cr ⁺⁶ , soluble	78.2 %	----	----
GP75644	JB51380-1	Cr ⁺⁶ , insoluble	85.0 %	----	----
GP75644	JB51380-1	Cr ⁺⁶ , post spike	99.2 %	----	----
QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery MS – Matrix spike Cr ⁺⁶ – Hexavalent chromium					

Duplicate Sample Analysis

All %RPD values observed in the general chemistry set of duplicate analyses were less than the laboratory QC limit of 20%RPD, as well as below the 35%RPD project QC limit for soil samples (USEPA, 2010; AECOM, 2010). The 13.3%RPD result for the duplicate Cr⁺⁶ analysis demonstrated acceptable analytical precision, as did the 14.4%RPD result for redox potential and 1.0%RPD for the pH analysis. Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries of 99.0 and 100.4%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed since it is not required by the analytical method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calibration curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100%
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample HD002 5-5.5 (JB51380-1) was listed as 1.4 mg/Kg on the reporting form and 0.0317 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.0317 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00243 \text{ Kg} \times 92.1/100} = \frac{0.00317}{0.002238} = 1.416 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 1.4 \text{ mg/Kg}$$

After rounding to two significant figures, this verifies that the hexavalent chromium concentration of 1.4 mg/Kg for Sample HD002 5-5.5 was correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 8 soil samples of this SDG, JB51380. Thus, all detected Cr⁺⁶ concentration results were below the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

With the exception of Sample JB51380-7 (< 0.45 mg/Kg Cr+6), which fell on the Eh-pH phase diagram line, all samples fell clearly below the Eh-pH phase diagram line depicting a reducing soil environment. The reported Cr+6 results are considered acceptable because the Cr+6 concentrations are less than 1.4 mg/Kg under a reducing environment, and are not expected to experience higher Cr+6 concentrations, since the highest observed total chromium result in any of these samples was only 26.6 mg/Kg (the corresponding Cr+6 concentration in this sample is 0.89 mg/Kg). Thus, the hexavalent chromium results are considered acceptable, as reported, with all hexavalent chromium concentrations less than 1.5 mg/Kg and thereby also below the SRS of 20 mg/Kg, as detailed in the text above.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were within QC limits, as were all other QC results associated with the hexavalent chromium analysis, including the duplicate sample analysis, no Cr⁺⁶ results were qualified following the DV review.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 51380

1. Were the appropriate sample preservation requirements met?..... Yes No
2. Were appropriate sample holding times
(for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

Samples were diluted for metals analysis due to matrix interference.
(2x) JB 51380 - 1, 2, 3, 4, 5, 6, 7.
(5x) JB 51380 - 8

4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

one nickel: JB 51380 - 1

6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.
No analytical procedural problems were noted.

JB51380

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2 and 3 for details.

Qualified sample results are presented in Table 4 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB51499
Sample Date: October 29, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: February 7, 2014

This data validation (DV) report presents the data review and result qualifications for sixteen (16) soil samples and one field blank (FB) collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on October 29, 2013 for sample delivery group (SDG) JB51499. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB51499 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 16 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony ("NJ-") in Samples JB51499-1 through -16 (inclusive);
- Chromium ("NJ-") in Samples JB51499-1 through -16 (inclusive);
- Nickel ("ENJ-") in Samples JB51499-1 through -16 (inclusive);
- Vanadium ("ENJ-") in Samples JB51499-1 through -16 (inclusive);

No other sample results in SDG JB51499 required qualification, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for seven nickel results and three hexavalent chromium results.

The sample results that were subject to qualification following the DV review are presented in Table 5 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The sixteen (16) soil samples and one field blank collected October 29, 2013, were received the same day at the Accutest laboratory in Dayton, NJ with an acceptable sampling cooler temperature of 4°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. preserved and in good condition with on October 31, 2013 with sampling cooler temperatures of 2.8°C. The field sample identification numbers and corresponding laboratory

identification numbers are as follows:

Table 1. Sample Receipt Summary – SDG JB51499

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
GD001 4-4.5	JB51499-1	10/29/2013	Soil	Metals, Cr+6
GD001 4.5-5	JB51499-2	10/29/2013	Soil	Metals, Cr+6

FD005 10-10.5	JB51499-14	10/29/2013	Soil	Metals, Cr+6
FD005 10.5-11	JB51499-15	10/29/2013	Soil	Metals, Cr+6
FD005 11-11.5	JB51499-16	10/29/2013	Soil	Metals, Cr+6
FB01	JB51499-17	10/29/2013	Aqueous	Metals, Cr+6

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast Inc, in Orlando FL.
 Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB51499, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) *“National Functional Guidelines for Inorganic Data Review”*, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006);
- *NJDEP Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary

and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. The soil sample results exhibited concentrations below the respective site remediation standard (SRS) levels in the 16 soil samples of this SDG, except for seven nickel results.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS)/matrix spike duplicate (MSD) recoveries were outside QC limits for antimony, chromium, nickel, and vanadium in QC Batch MP26322,. However, the 78.0% MSD recovery for nickel is actually within the DV QC limits of 75-125% (NJDEP, 2002). The case narrative stated that the serial dilution results were outside QC limits for chromium, nickel, and vanadium in the soil QC batch and the percent difference values were acceptable because the low initial sample concentration ($< 50 \times \text{IDL}$). However, this statement conflicts with the actual data, where it was observed that the initial concentrations for nickel and vanadium were $> 50 \times \text{IDL}$ and, therefore, are subject to qualification.

All other QC requirements were met, including analyses for hexavalent chromium, pH, oxidation reduction potential, and total solids analysis. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the internal standard area counts identified below.

The exceptions included the internal standard (IS) area counts for IS#1 and IS#2 which are associated with antimony, and chromium and vanadium, respectively, in analytical run MA11198.

However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Consequently, the one affected sample in MA11198, JB51499-13 (119%), was not reanalyzed, as the IS area counts are considered acceptable, when based on the preceding method blank (MB) area counts. The duplicate sample analysis and the MS/MSD and post spike results were identified as having area counts above the QC requirement. However, when based on the preceding MB area counts, the area count recoveries were all under 120% and considered acceptable, hence they were not reanalyzed. Consequently, no soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB51499.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries were within the QC limits of 75 - 125% for QC samples in the one identified QC batch for the soil samples, except for those recoveries identified below in Table 2.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26322 Ω	JB51432-1	Antimony	28.2 %	29.0 %	NJ-	Low
MP26322 Ω	JB51432-1	Chromium	69.3 %	74.7%	NJ-	Low
MP26322 Ω	JB51432-1	Nickel	72.9 %	78.0 %	NJ-	Low
MP26322 Ω	JB51432-1	Vanadium	70.0 %	74.0 %	NJ-	Low
QC Limits are 75-125%; NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. MS – Matrix spike MSD – Matrix spike duplicate. Ω – The samples associated with QC Batch MP26322 consist of JB51499-1 through -16 (inclusive).						

The MS and MSD recoveries outside QC limits in Table 2 indicate possible matrix interference and/or possible sample non-homogeneity.

The antimony, chromium, nickel, and vanadium results in all of the 16 affected soil samples are flagged with “NJ-” due to a potential low bias. These individual qualified sample results are presented below in summary table, Table 5, together with the sample results qualified for the serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on a non-client QC samples with concentrations not different from those observed in PPG soil and aqueous samples. All %RPD values were below the QC limit of 35%RPD for soil samples, as well as the 20%RPD QC limit for aqueous samples and no results required qualification. The duplicate analyses demonstrated acceptable analytical precision with all RPD values below 14.3 %RPD, regardless of matrix.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 86.9% - 96.0% for the soil sample metals analysis, and 93.5 to 104.2% for the aqueous analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative also stated that the RPDs for chromium, nickel and vanadium are outside QC limits in the QC batch associated with the soil samples, but that the percent difference values were acceptable due to the low initial sample concentration (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010). However, closer inspection revealed that the initial concentrations for nickel and vanadium were, in fact, above the criterion of 50 × IDL and, therefore, subject to qualification, as summarized below in Table 3. Thus, the affected nickel and vanadium results in the samples associated with these %D exceedances were subject to qualification following the DV review, as discussed below. These QC results are detailed in Table 3 below.

Table 3. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26322 Ω	JB51432-1	Nickel	11.8 %D	EJ
MP26322 Ω	JB51432-1	Vanadium	10.8 %D	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Ω – The samples associated with QC Batch MP26322 consist of JB51499-1 through -16 (inclusive).

The associated nickel and vanadium results in samples with laboratory sample ID numbers identified in Table 3 for the associated samples are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 5, along with the results qualified for matrix spike recoveries outside QC limits. Thus, the nickel and vanadium results for these samples are flagged with the combination of qualifiers as “ENJ-”.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Nickel (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)

V = final volume (mL)
 DF = Dilution factor
 W = wet weight (g)
 TS = Total solids (%)
 1000 = conversion factor (mL/L)

The nickel concentration for Sample FD005 10-10.5 (JB51499-15) was listed as 31.5 mg/Kg on the reporting form and 0.5832 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Nickel (mg/Kg)} = \frac{(583.2 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.15 \text{ g}) (80.6/100\%)} = \frac{29,160}{926.9} = 31.4597 \mu\text{g/g}$$

$$= 31.5 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the antimony concentration of 31.5 mg/Kg for Sample FD005 10-10.5 was correctly reported. This concentration marginally exceeded the nickel SRS of 31 mg/Kg.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 15 of the 16 soil samples for metals analysis that had been diluted by a factor of either two, five, or ten.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where two samples were diluted by a factor of 5x and 10x, thereby raising the reporting limit for the antimony and thallium results above the respective SRS, as presented below in Table 4, diluted possibly due to elevated levels of chromium in the samples or sample/digestate appearance.

Table 4. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
FD005 10.5-11	JB51499-15	Antimony	< 2.2	5	< 11	6
FD005 11-11.5	JB51499-16	Antimony	< 1.2	10	< 12	6
FD005 11-11.5	JB51499-16	Thallium	< 0.58	10	< 5.8	3
Units – mg/Kg						
< - The analyte was analyzed for, but was not detected above the stated reporting limit.						

The interpretation of these non-detect soil results was not compromised by the applied dilution, because the nickel results in these two samples (31.5 mg/Kg and 33.2 mg/Kg) were above the SRS value of 31 mg/Kg and, thus, potentially subject to some sort of response action or further evaluation.

Summary

The soil sample analytical results for the samples of SDG JB51499 were found to be compliant with the analytical methods for the analysis of metals in the sixteen soil samples and one field blank using SW-846 Method 6010C.

The QC criteria were met for the metals target analyte analyses, except for the low matrix spike recoveries for antimony, chromium, nickel, and vanadium in the QC batch associated with 16 soil samples and are flagged with "NJ-" suggesting a potential low bias.

The serial dilution results for nickel and vanadium in the QC sample associated with the 16 soil samples were above the QC limit of 10.0 %D, suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the identified nickel and vanadium results are qualified as estimated values and are flagged with "ENJ-" in the 16 samples, as presented below in Table 5, because of the low MS recoveries, as well.

Table 5. Summary Qualified Sample Metals Results in SDG JB51499

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
GD001 4-4.5	JB51499-1	Antimony	< 2.0	NJ-
GD001 4-4.5	JB51499-1	Chromium	12.7	NJ-
GD001 4-4.5	JB51499-1	Nickel	37.0	ENJ-
GD001 4-4.5	JB51499-1	Vanadium	11.6	ENJ-
GD001 4.5-5	JB51499-2	Antimony	< 1.9	NJ-
GD001 4.5-5	JB51499-2	Chromium	12.3	NJ-
GD001 4.5-5	JB51499-2	Nickel	26.2	ENJ-
GD001 4.5-5	JB51499-2	Vanadium	12.6	ENJ-
GD001 5-5.5	JB51499-3	Antimony	< 1.9	NJ-
GD001 5-5.5	JB51499-3	Chromium	9.9	NJ-
GD001 5-5.5	JB51499-3	Nickel	22.8	ENJ-
GD001 5-5.5	JB51499-3	Vanadium	12.0	ENJ-
GD001 5.5-6	JB51499-4	Antimony	< 1.7	NJ-
GD001 5.5-6	JB51499-4	Chromium	10.8	NJ-
GD001 5.5-6	JB51499-4	Nickel	63.1	ENJ-
GD001 5.5-6	JB51499-4	Vanadium	10.2	ENJ-
FD003 5-5.5	JB51499-5	Antimony	< 2.1	NJ-
FD003 5-5.5	JB51499-5	Chromium	29.8	NJ-
FD003 5-5.5	JB51499-5	Nickel	36.3	ENJ-
FD003 5-5.5	JB51499-5	Vanadium	12.1	ENJ-
FD003 5.5-6	JB51499-6	Antimony	< 2.2	NJ-
FD003 5.5-6	JB51499-6	Chromium	30.9	NJ-
FD003 5.5-6	JB51499-6	Nickel	21.7	ENJ-
FD003 5.5-6	JB51499-6	Vanadium	10.5	ENJ-

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.

NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the soil samples and one batch for the field blank.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in 13 of the 16 soil samples, with three of the reported Cr+6 results above the SRS of 20 mg/Kg. No Cr+6 results required qualification in this SDG, JB51499.

Case Narrative

The case narrative indicated that all QC requirements were met, and that good recoveries were achieved for the matrix spike analyses.

Calibrations

The initial calibrations for the various Cr+6 analyses demonstrated acceptable correlation coefficients with values of at least 0.99973, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered between 92.2% and 92.5% for soil analyses and 97.6 to 97.9% for the FB analysis, thereby meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in the method blanks (< 0.40 mg/Kg), continuing calibration blanks or field blank (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The soluble and insoluble matrix spike recoveries for hexavalent chromium, as well as the post-digestion spikes, were below the respective QC limits for both soil QC batches, as well as the aqueous sample batch, thereby demonstrating acceptable accuracy and no hexavalent chromium results were qualified following the DV review. The spike recoveries ranged 96.7% to 103.5%, well within QC limits.

Duplicate Sample Analysis

All duplicate analyses met QC requirements with values less than 5.7 %RPD, including redox potential and pH analyses, except for the 22.7 %RPD value for Cr+6 analysis in QC Batch GP75698, a value still below the suggested 35%RPD QC limit for soil analysis (USEPA, 2010). Consequently, no sample results associated with this SDG, SDG JB51499, are subject to qualification for analytical precision issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 88.5% to 100.0%, thereby demonstrating acceptable analytical system performance for both the soil and aqueous analyses.

Sample Result Verification

The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where:

- A = conc. from calib. curve (mg/L)
- B = Final digested volume (L)
- C = Wet wt of sample (Kg)
- D = % Solids/100
- E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample FD005 10-10.5 (JB51499-15) was listed as 30.3 mg/Kg on the reporting form and 0.6103 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.6103 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.0025 \text{ Kg} \times 80.6\%/100\%} = \frac{0.06103}{0.002015} = 30.2878 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 30.3 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 30.3 mg/Kg for Sample FD005 10-10.5 was correctly reported. This was the highest detected Cr+6 concentration detected among the sixteen soil samples of this SDG, JB51499. There were three Cr+6 results above the SRS of 20 mg/Kg in this SDG.

pH/Eh (ORP)

The pH and Eh (ORP) data were reviewed and determined to have acceptable QC results and are correctly reported on the sample "Report of Analysis" forms, which essentially serve as the "Form I" for reporting results.

The pH and Eh results were compared to the Eh-pH phase diagrams and verified that the sample points are correctly located on the diagrams. All sample results were observed to fall under the Eh-pH phase diagram line, thereby demonstrating "reducing" conditions, with the possible exception of JB51499-8 which may be marginally above the Eh-pH line and whose Cr+6 concentration was only 11.5 mg/Kg. Hexavalent chromium was detected in 13 of the 16 soil samples of JB51499 at concentrations of 15.9 mg/Kg or less, except for the elevated Cr+6 results in samples JB51499-13, -15, and -16 which were above the SRS of 20 mg/Kg.

Summary of Hexavalent Chromium Results in SDG JB51499

The soil sample analytical results for the samples of SDG JB51499 met all QC requirements of the hexavalent chromium analyses, such that no sample Cr+6 results required qualification.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
EJ	The reported value is estimated because of the presence of interference.

Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 51499

1. Were the appropriate sample preservation requirements met?..... Yes No
2. Were appropriate sample holding times
(for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

Matrix interference for metals analysis.
(2x) JB 51499 - 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 14.
(5x) JB 51499 - 11, 15
(10x) JB 51499 - 16

4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

*Antimony in JB 51499 - 15, 16.
Thallium in JB 51499 - 16*

5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

*Seven nickel : JB 51499 - 1, 4, 5, 13, 14, 15, 16.
Three Cr⁺⁶ : JB 51499 - 13, 15, 16.*

6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

*Refer to DV report discussions of case narrative regarding QC limit exceedances.
No analytical procedural problems were noted.*

JTB 51499

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Not applicable

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report tables 2 and 3 for details.

Qualified sample results are presented in Table 5 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB51636
Sample Date: October 29 & 30, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
SPLP Leachate, EPA Methods 1312, 6010C
Percent Solids, SM2540 G-97
Reviewer: J. Giga. Ph.D., REP5554
Report Date: December 17, 2013

This data validation (DV) report presents the data review and result qualifications for fifteen (15) soil samples collected at the PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on October 29 and 30, 2013 for sample delivery group (SDG) JB51636. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB51636 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 15 collected soil samples.

Following the detailed DV review, the following sample results were qualified:

- Antimony (*NJ-) in Samples JB51636-1 through -9 (inclusive), and JB51636-13 through -16 (inclusive);
- Chromium (ENJ-) in Samples JB51636-1 through -9 (inclusive), and JB51636-13 through -16 (inclusive);
- Nickel (*EJ) in Samples JB51636-1 through -9 (inclusive), JB51636-11, and JB51636-13 through -16 (inclusive);
- Vanadium (ENJ-) in Samples JB51636-1 through -9 (inclusive), and JB51636-13 through -16 (inclusive).

No other sample results in SDG JB51636 required qualification, including hexavalent chromium results, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below.

Quality control (QC) criteria were met for each of the ICP target analyte analyses, except for the low matrix spike (MS) recoveries for antimony, chromium, and vanadium in the MS and MS duplicate (MSD) samples recovered below the QC limits of 75-125% for the QC sample in QC Batch MP26264. The duplicate analysis was outside QC limits for antimony and nickel, such that the associated sample results are qualified as estimated values and flagged with "*J" due to a potential variability in the analytical precision. The serial dilution analysis results for chromium, nickel and vanadium were above the QC limit of 10%D such that the chromium, nickel and vanadium results in the associated samples are qualified as estimated values and flagged with "EJ" due to the possible presence of an interference. Since the antimony, chromium, and vanadium spike recoveries were below control limits in the QC batch samples, the results in the associated samples of SDG JB51636 are qualified as estimated values and flagged with "NJ-" due

to a possible low bias in the ability to recover these three analytes in the sample matrix. Consequently, the antimony, chromium, nickel and vanadium results in 14 soil samples are qualified as estimated values and flagged with the qualifier flags “*NJ-”, “ENJ-”, “*EJ”, and “ENJ-”, respectively, and “*EJ” for nickel in JB51636-11, to indicate that the sample results are estimated values for various QC issues.

The site remediation standard (SRS) of 31 mg/Kg for nickel was either met or exceeded in six soil samples of this SDG.

The hexavalent chromium analyses were performed at the Dayton, NJ laboratory and no sample results required qualification, as all QC requirements were met. Hexavalent chromium was detected in nine of the fourteen soil samples, with four concentrations exceeding the SRS of 20 mg/Kg.

The sample results that were subject to qualification following the DV review are presented in Table 5 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The fifteen (15) soil samples collected October 29 & 30, 2013, were received at the Accutest laboratory October 30, 2103 with acceptable sampling cooler temperatures of 2.1°C. The samples destined for metals analysis were received at the Accutest Laboratories Southeast, Inc. in Orlando, Florida November 2, 2013 preserved and in good condition with sampling cooler temperatures of 3.4°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Client Sample Designation	Sample Lab ID Number	Date Collected	Matrix	Analyses
HD001 0"-6"	JB51636-1	10/30/13	Soil	Metals, Cr+6
HD001 2-2.5	JB51636-2	10/30/13	Soil	Metals, Cr+6
HD001 4-4.5	JB51636-3	10/30/13	Soil	Metals, Cr+6

FD007 4-4.5	JB51636-10	10/30/13	Soil	SPLP Leachate Ni
FD007 4-4.5	JB51636-11	10/30/13	Soil	Ni
FD007 5.5-6	JB51636-13	10/30/13	Soil	Metals, Cr+6
FD007 6.5-7	JB51636-14	10/30/13	Soil	Metals, Cr+6
FD007 7.5-8	JB51636-15	10/30/13	Soil	Metals, Cr+6
FD007 8.5-9	JB51636-16	10/30/13	Soil	Metals, Cr+6
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories in Orlando, FL. (Ni = nickel)				
Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ.				

Data Review

Data, as presented in the analytical data package SDG JB51636, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) "*National Functional Guidelines for Inorganic Data Review*", OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. The data for the SPLP leachate analysis of sample JB51636-10 were also reviewed. Several sample results exhibited concentrations above the respective site remediation standard (SRS) in some of the 15 soil samples of this SDG. These consisted of six nickel results.

Laboratory Case Narrative

The metals analyses were performed at the Accutest Laboratories in Orlando, Florida after having received the samples in a properly preserved condition. The extensive case narrative identified all analytes for the samples that were diluted, listing them individually by analyte in random fashion. Matrix spike recoveries for antimony, chromium, and vanadium were identified as being outside QC limits in QC Batch MP26264, while duplicate analysis results for antimony, chromium, and nickel were said to be outside QC limits in the QC batch. Serial dilution results outside QC limits were indicated for chromium, nickel, and vanadium in the QC batch sample. All other QC requirements were met, including analyses for pH, oxidation reduction potential, total solids, and the SPLP leachate analysis. Details are discussed in the sections below. Consequently there were many

metals results that required qualification following the DV review, as discussed in the sections and tables below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the recoveries identified below.

The exceptions included the closing low calibration check standard in analytical run MA11181 (56%) for antimony. This low recovery did not significantly affect the reported results. The low "CRI" standard recovery in MA11181 was associated with the following samples: JB51636-1, -6, -7, -9, -11, -13, -14, -15, and -16. Because the reporting limits for these samples are above the affected range, the results are not subject to qualification. Additionally, the antimony results for these samples are already qualified as estimated values for low matrix spike recoveries and duplicate analysis outside QC limits. No additional qualification is warranted.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB51636.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony, chromium, and vanadium were below QC limits of 75% for QC sample JB51636-1 (HD001 0"-6"), as summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. None of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits. Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a possible low bias in the ability to recover the particular analyte in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Below QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	Post Digest. Spike	DV Qualifier	Potential Bias
MP26264 Ω	JB51636-1	Antimony	40.0 %	50.5 %	90.5 %	NJ-	Low
MP26264 Ω	JB51636-1	Chromium	65.6 %	95.2 %	92.8 %	NJ-	Low
MP26264 Ω	JB51636-1	Vanadium	32.0 %	37.7 %	104.5 %	NJ-	Low

QC Limits are 75-125%; Post-digestion spike QC is 80-120%
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a

potential low bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate
 Ω – The samples associated with QC Batch MP26264 consist of JB51636-1 through -9 (inclusive), JB51636-11, and JB51636-13 through -16 (inclusive).

The low recoveries of antimony, chromium and vanadium in Sample JB51636-1 (HD001 0"-6") in the MS/MSD samples in QC Batch MP26264 are associated with thirteen samples with laboratory sample ID numbers ranging JB51636-1 through -9, and -13 through -16 (inclusive). The soil sample results qualified for the observed low matrix spike recoveries are presented below in summary table, Table 5, together with the results qualified for duplicate sample and serial dilution analysis results.

As observed in Table 5, antimony was detected in only four of the soil samples associated with the low spike recoveries. Although a possible low bias may raise question regarding the accuracy of these reported antimony results, the potential low bias represented by the approximately 50% spike recoveries, will not significantly affect interpretation of the antimony results because those samples with detected antimony concentrations have at least one other analyte above the SRS criterion. Similarly, the detected chromium and vanadium concentrations are considerably less than the SRS value, with detected chromium results being orders of magnitude less than the SRS of 120,000 mg/Kg.

Consequently, the potential low bias should not affect interpretation of the antimony, chromium or vanadium results in each of the samples associated with the low QC MS/MSD recoveries. Thus, the interpretation of these antimony, chromium and vanadium results appears to not significantly affected by any possible low bias in the soil sample concentrations.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on Sample JB51636-1 (HD001 0"-6"), as well as the spiked duplicate samples of JB51636-1 (HD001 0"-6") for the soil samples of this SDG. Soil sample aliquots from JB51636-1 had been spiked in duplicate, such that an evaluation of analytical precision for these spiked samples could also be evaluated. The differences between the duplicate soil sample aliquots were above the laboratory QC limit of 20%RPD for antimony(148.4%RPD) and nickel (110.3%RPD), as well as above the 35%RPD QC limit for soil samples recommended in DV guidelines (USEPA, 2010) for antimony and nickel. A possible cause of the observed differences between the duplicate results may be attributable to sample non-homogeneity. The differences between the spiked duplicate soil sample aliquots were below the 35%RPD QC limit recommended in DV guidelines for all five analytes.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
MP26264	JB51636-1	Antimony	148.4 %RPD	*J
MP26264	JB51636-1	Nickel	110.3 %RPD	*J

QC Limit is 35%RPD;

* – Duplicate analysis not within control limits; indeterminate bias direction.

J – The reported result is an estimated value.

Ω – The samples associated with QC Batch MP26264 consist of JB51636-1 through -9 (inclusive), JB51636-11, and JB51636-13 through -16 (inclusive).

Since antimony and nickel had exceeded the QC limit for duplicate soil sample analysis, the associated PPG samples with laboratory ID numbers ranging JB51636-1 through -9, -13 through -

16, as well as the nickel result in -11 were qualified as estimated values due to the potential variability in the analytical precision, and are flagged with “*J” in the summary table below, Table 5. All other duplicate analysis results met the QC limits for soil samples, either < 35%RPD, or were less than twice the CRDL value or reporting limit.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 97.0% - 104.4%.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified that the chromium, nickel and vanadium serial dilution results were outside QC limits in QC Batch MP26264. These are detailed in Table 4 below. The associated chromium, nickel, and vanadium results in samples with laboratory sample ID numbers ranging JB51636-1 through -9, and -13 through -16, as well as the nickel; result in -11 are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 5, along with the results qualified for low matrix spike recoveries and variability in the analytical precision analysis.

Table 4. Serial Dilution Results Outside QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26264	JB51636-1	Chromium	16.9 %	EJ
MP26264	JB51636-1	Nickel	17.4 %	EJ
MP26264	JB51636-1	Vanadium	14.6 %	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

No field duplicate sample collection was requested.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported nickel results:

$$\text{Nickel (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The nickel concentration for Sample HD001 8-8.5 (JB51636-5) was listed as 1,450 mg/Kg on the reporting form and 19.78 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Nickel (mg/Kg)} &= \frac{(19.780 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.17 \text{ g}) (58.4\%/100\%)} = 1447.430 \mu\text{g/g} \\ &= 1,450 \text{ mg/Kg dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the nickel concentration of 1,450 mg/Kg for Sample HD001 8-8.5 was correctly reported. Note that the software incorporates the dilution

factor into the mg/L value in the raw data quant report, hence a dilution factor of only one (DF = 1) appears in the equation above.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of nine soil samples that had been diluted by a factor of either two or five for all five analytes or just a few select analytes. The reporting limits for the target analytes determined for the ICP analysis employing the various assigned laboratory instruments all were below the respective site remediation standards.

Summary of Metals Analysis

The soil sample analytical results for the samples of SDG JB51636 were found to be compliant with the analytical methods for the analysis of metals in the fifteen soil samples using SW-846 Method 6010C. All QC criteria were met for all ICP target analyte analyses, except for the low matrix spike recoveries for antimony, chromium, and vanadium in the QC batch. The soil samples collected September 29 and 30, 2013 are qualified as estimated values for antimony, chromium, and vanadium (flagged "NJ-") in the thirteen associated soil samples due to a potential low bias, as summarized below in Table 5. The antimony and nickel results are qualified as estimated values and flagged with "*J" in the thirteen associated soil samples, with the nickel result in JB51636-11 also flagged with "*J" due to possible variability in the analytical precision, as suggested by the results of the duplicate analysis. The serial dilution results were outside QC limits suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the chromium, nickel and vanadium results are qualified as estimated values and are flagged with "EJ" in Table 5 below, such that the combination of qualifiers appear as "ENJ-", "*EJ", and "ENJ-", respectively, for these three analytes.

Table 5. Summary Qualified Sample Metals Results in SDG JB51636

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
HD001 0"-6"	JB51636-1	Antimony	< 1.0	*NJ-
HD001 0"-6"	JB51636-1	Chromium	25.1	ENJ-
HD001 0"-6"	JB51636-1	Nickel	18.7	*EJ

FD007 8.5-9	JB51636-16	Nickel	33.1	*EJ
FD007 8.5-9	JB51636-16	Vanadium	11.6	ENJ-

Key:

- < –The analyte was analyzed for, but was not detected above the stated reporting limit.
- N – The matrix spike sample recovery in the associated QC sample is not within QC limits.
- J – Indicates an estimated value.
- J- – The result is an estimated value, but the result may be biased low.
- * – Duplicate analysis not within control limits; indeterminate bias direction.
- E – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁶⁺) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the soil samples.

The data validation of the analytical data was reviewed for the following data quality items:

- √ Holding times
- √ Blank Analysis
- √ Calibration standards
- √ Calibration verification
- √ Quantitation checks
- √ Data package completeness
- √ Matrix spike recoveries
- √ Duplicate analysis
- √ Laboratory control samples
- √ Serial dilution analysis
- √ Data qualifiers

A check mark (√) indicates successful achievement of meeting the relevant QC requirements.

Hexavalent chromium was detected in nine of the fourteen soil samples, with four concentrations exceeding the SRS of 20 mg/Kg. Because all QC requirements were met during the Cr⁺⁶ analysis, no hexavalent chromium results are qualified in this SDG.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient with a value of 0.99979, a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 94.8 % to 96.4 % for the QC batch associated with the 13 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%. No hexavalent chromium results required qualification.

Duplicate Sample Analysis

The duplicate analyses met QC requirements with values less than 16.5 %RPD, including Cr⁺⁶, redox potential and pH analyses. Thus, no hexavalent chromium results warranted qualification in this SDG.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries of 95.3% and 98.5%, thereby demonstrating acceptable analytical system performance.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample FD007 5.5-6 (JB51636-13) was listed as 71.9 mg/Kg on the reporting form and 0.734 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.734 \text{ mg/L} \times 0.1 \text{ L} \times 2}{0.00243 \text{ Kg} \times 84.0/100} = \frac{0.1468}{0.0020412} = 71.9185 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 71.9 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 71.9 mg/Kg for Sample FD007 5.5-6 was correctly reported. This was the highest detected Cr+6 concentration detected among the fourteen soil samples of this SDG, JB51636. This was one of four detected Cr+6 concentration results above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams, thereby demonstrating reducing conditions for the analyzed samples. No disparities relative to the reported values and characteristics were observed.

Summary of Wet Chemistry Analyses for SDG JB51636

No results were subject to qualification in the hexavalent chromium analyses, or the pH, redox potential or total solids analyses.

All sample results fell under the Eh/pH phase diagram line, indicating that reducing conditions in the soil matrix were demonstrated for the samples.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 51636

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No

Indicate the identity of the samples and why. *Matrix interference*

2x JB 51636-2, 3, 4, 5, 8 (metals)
 2x JB 51636-13 (Cr⁶⁺)
 5x JB 51636-6 (Cr); 13-15 (for Sb, Cr, TI)

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Six nickel results: JB 51636-4, 5, 6, 8, 9, 16.

four Cr⁶⁺: JB 51636-6, 7, 11, 15.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No problems with analytical procedures were noted.

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, and 4 for details. Qualified sample results are presented in Table 5 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB51750
Sample Date: October 30 & 31, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
SPLP Leachate Analysis, EPA Method 1312
Reviewer: J. Giga. Ph.D., REP5554
Report Date: March 11, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-two (22) soil samples and two (2) field blanks (FBs) collected at the PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on October 30 and 31, 2013 for sample delivery group (SDG) JB51750. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB51750 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 22 collected soil samples and two FBs.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB51750-1 through -5 (inclusive), JB51750-7, JB51750-10 through -14, JB51750-16 through -20, JB51750-22 through -25, JB51750-27, and -28;
- Chromium (ENJ+) in Samples JB51750-2 through -5, JB51750-7, and JB51750-10 through -14 (inclusive);
- Chromium and vanadium (NJ+) in Samples, JB51750-16 through -20, JB51750-22 through -25, JB51750-27, and -28;
- Nickel and vanadium (EJ) in Samples JB51750-2 through -5, JB51750-7, and JB51750-10 through -14 (inclusive);
- Hexavalent chromium (NJ-) in Samples JB51750-2 through -5, JB51750-7, and JB51750-10 through -14 (inclusive);
- Hexavalent chromium (J) in field duplicate samples JB51750-20 and JB51750-25;

No other sample results in SDG JB51750 required qualification. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for 15 nickel results, three hexavalent chromium (Cr+6) and one antimony result.

The sample results that were subject to qualification following the DV review are presented in Tables 6 and 8 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The twenty-two (22) soil samples and two (2) field blanks collected October 30 and 31, 2013, were received October 31, 2013 at the Accutest laboratory with acceptable sampling cooler temperatures of 0.6°C. The samples destined for metals analysis were received at the Accutest Laboratory SE in Orlando, Florida November 2, 2013 preserved and in good condition with sampling cooler temperatures of 4.0°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

GD007 8.5-9	JB51750-25	10/31/13	Soil	Metals, Cr+6
GD008 6-6.5	JB51750-27	10/31/13	Soil	Metals, Cr+6
GD008 7-7.5	JB51750-28	10/31/13	Soil	Metals, Cr+6
FB 02	JB51750-29	10/31/13	Aqueous	Metals, Cr+6
FB 03	JB51750-30	10/31/13	Aqueous	Metals, Cr+6

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories SE in Orlando, FL. (Sb = antimony);
 SPLP Leachate analyzed for antimony using prep method 1312, and 6010C.
 Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB51750, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) "*National Functional Guidelines for Inorganic Data Review*", OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | Field duplicate sample analysis |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Sample JB51750-1 was analyzed for antimony, while JB51750-1A was analyzed for the SPLP leachate analysis of antimony. Several sample results exhibited concentrations above the respective site remediation

standard (SRS) in some of the 22 soil samples of this SDG. These included 15 nickel and one antimony result.

Laboratory Case Narrative

The extensive case narrative identified all analytes for the samples that were diluted, listing them individually by analyte in random fashion. Matrix spike recoveries for antimony and chromium were identified as being outside QC limits in QC Batch MP26265 and antimony, chromium, and vanadium were identified as being outside QC limits in QC Batch MP26327. The case narrative identified the serial dilution results being outside QC limits in QC Batch MP26265 for chromium, nickel, and vanadium and stated that the differences were acceptable due to low initial sample concentration (< 50 times IDL). However, each of these three analyte concentrations in QC Sample JB51679-1 were clearly above the criterion of 50 times IDL and thus, are subject to qualification, as is discussed below. All other QC requirements were met, including analyses for pH, oxidation reduction potential, total solids, and the leachate analysis. Details are discussed in the sections below. The metals analyses were performed at the Accutest Laboratories Southeast in Orlando, Florida.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the internal standard area counts identified below.

The exceptions included the internal standard area counts for IS#2 which is associated with chromium and vanadium in analytical run MA11182. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Consequently, the two affected samples in MA11182, JB51750-10 (128%) and -11 (126%) were not reanalyzed, as the IS area counts are considered acceptable.

In the analytical sequence MA11202, the area counts for JB51750-1 and -22 were identified as being outside QC limits on the QC summary report. However, review of the data revealed that the area counts for IS#2 for JB51750-1 (121%) and JB51750-22 (123%) were actually within the previous QC limits of 60-125%. Thus, the samples did not warrant reanalysis and the results for chromium and vanadium are considered acceptable for these two samples.

No soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank, the continuing calibration blanks, or the field blanks at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB51750.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony, chromium, and vanadium were outside QC limits of 75 - 125% for QC samples in the two identified QC batches, as summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. None of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits. Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with either "J+" or "J-" to indicate the possible presence of a possible high or low bias in the ability to recover the particular analyte in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26265 Ω	JB51679-1	Antimony	26.5 %	26.8 %	NJ-	Low
MP26265 Ω	JB51679-1	Chromium	128.5 %	87.8 %	NJ+	High
MP26327 †	FA9687-1	Antimony	44.7 %	54.4 %	NJ-	Low
MP26327 †	FA9687-1	Chromium	171.8%	137.6 %	NJ+	High
MP26327 †	FA9687-1	Vanadium	157.1 %	130.1 %	NJ+	High

QC Limits are 75-125%;
NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.
MS – Matrix spike
MSD – Matrix spike duplicate
Ω – The samples associated with QC Batch MP26265 consist of JB51750-2 through -5, JB51750-7, and JB51750-10 through -14 (inclusive);
† – The samples associated with QC Batch MP26327 consist of JB51750-1, JB51750-16 through -20, JB51750-22 through -25, JB51750-27, and JB51750-28.

The spike recoveries for chromium were observed to be biased high, however, the chromium concentration in the initial QC sample (FA9687-1) was almost four times the spike amount and some masking of the spike might have been partially responsible for the elevated MS/MSD recoveries. The chromium results in the associated samples were qualified as estimated values and flagged with "NJ+" due to a potential positive bias in the ability to recover chromium in the associated samples, which included those with laboratory sample ID numbers JB51750-1, JB51750-16 through -20, -22 through -25, -27, and -28. The chromium MS recovery in the other QC batch was also above QC limits. Since these samples are associated with an elevated serial dilution result, the chromium results in the following samples are flagged with "ENJ+", as seen in the cumulative table, Table 6: JB51750-2 through -5, JB51750-7, and JB51750-10 through -14 (inclusive). The vanadium results for these samples are also flagged with "NJ+", while the antimony results in all of these samples and JB51750-1 are flagged with "NJ-" due to a potential low bias. These results qualified for matrix spike recoveries are presented below in summary table, Table 6, together with the results qualified for serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on two QC samples and on two pairs of spiked duplicate samples. All %RPD values were below the QC limit of 35%RPD for soil samples and no results required qualification. The RPD values ranged 0-31.8 %RPD for the duplicate samples analyses, and 2.3-19.5%RPD for the spiked duplicate data. Thus, the duplicate analyses demonstrated acceptable analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 91.1% - 102.4%.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the serial dilution results being outside QC limits in QC Batch MP26265 for chromium, nickel, and vanadium and stated that the differences were acceptable due to low initial sample concentration (< 50 times IDL). However, each of these three analyte concentrations in JB51679-1 were clearly above the criterion of 50 times IDL and thus, are subject to qualification, as is discussed below. These are detailed in Table 3 below.

Table 3. Serial Dilution Results Outside QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26265 Ω	JB51679-1	Chromium	46.3 %	EJ
MP26265 Ω	JB51679-1	Nickel	47.3 %	EJ
MP26265 Ω	JB51679-1	Vanadium	24.6 %	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Ω – The samples associated with QC Batch MP26265 consist of JB51750-2 through -5, JB51750-7, and JB51750-10 through -14 (inclusive).

The associated chromium, nickel, and vanadium results in samples with laboratory sample ID numbers ranging JB51750-2 through -5, -7, and -10 through -14, inclusive, are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 6, along with the results qualified for matrix spike recoveries outside QC limits.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

Two sets of field duplicate samples were collected as part of SDG JB51750. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying results from the USEPA CLP program for soil samples analyzed by ICP-AES using the CLP Statement of Work (SOW) ISM01.X (but not Method 6010C) that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2012; AECOM, 2010).

The results for the analysis of the two pairs of field duplicate samples are presented in Table 4, below. It is evident that the results for the metals analytes that were detected in the field duplicate samples were very similar and, thus, considered representative, as the concentrations between

field duplicate samples differed by less than 43 %RPD or differed by less than two times the reporting limit value (< 2 × CRQL) for all analyte pairs, except for the chromium results for the field duplicates from GD005 9-9.5, thereby meeting the QC limits for field duplicate samples for all but one parameter.

Table 4. Comparison of Field Duplicate Soil Sample Results – SDG JB51750

Analyte	GD005 9-9.5 (mg/Kg)	DUP 02 (mg/Kg)	% RPD	DV Flag
Antimony	< 4.8 NJ-	< 0.93 NJ-	< 2 × CRQL	-
Chromium	20.0 NJ+	45.5 ENJ+	77.9 %	(J)
Nickel	31.0	27.5 EJ	12.0 %	-
Thallium	< 2.4	< 0.46	< 2 × CRQL	-
Vanadium	22.0 NJ+	14.3 EJ	42.4 %	-
Analyte	GD007 8.5-9 (mg/Kg)	DUP 03 (mg/Kg)	% RPD	DV Flag
Antimony	< 4.5 NJ-	< 4.6 NJ-	< 2 × CRQL	-
Chromium	28.4 NJ+	28.7 NJ+	1.0 %	-
Nickel	23.3	22.9	1.7 %	-
Thallium	< 2.3	< 2.3	< 2 × CRQL	-
Vanadium	20.0 NJ+	18.8 NJ+	6.2 %	-

NJ+ – The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
 < – The analyte was not detected at the stated reporting limit.
 EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
 (J) – Sample result is subject to DV qualification, but not additionally flagged with “J” to avoid redundancy;
 CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit.
 < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

This pair of field duplicate samples demonstrated acceptable sampling representativeness and precision for the five target metals analyzed. The only results subject to qualification were the chromium results for samples GD005 9-9.5 and DUP 02. However, since these chromium results are qualified for elevated MS recoveries and exhibit a potential positive bias, the results were not flagged with an additional “J” flag in order to avoid redundancy in qualifiers.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Nickel (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)

V = final volume (mL)
 DF = Dilution factor
 W = wet weight (g)
 TS = Total solids (%)
 1000 = conversion factor (mL/L)

The nickel concentration for Sample GD005 6-6.5 (JB51750-16) was listed as 31.0 mg/Kg on the reporting form, a value equal to the SRS, and 0.5793 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Nickel (mg/Kg)} = \frac{(579.3 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.07 \text{ g}) (87.2\%/100\%)} = \frac{28,965.0}{933.04} = 31.0437 \mu\text{g/g}$$

$$= 31.0 \text{ mg/Kg dry weight}$$

After rounding to three significant figures, this verifies that the nickel concentration of 31.0 mg/Kg, a value equal to the SRS for nickel, in Sample GD005 6-6.5 was correctly reported.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 13 of the 22 soil samples that had been diluted by a factor of either two, four, five or ten for metals analysis, while two samples were diluted by a factor of 5x for Cr+6 analysis due to elevated Cr+6 concentrations above the calibration range of the instrument.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where Sample JB51750-22 was diluted by a factor of 10x, thereby raising the reporting limit for the thallium result above the respective SRS criterion, as presented below in Table 5, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 5. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
GD007 5.5-6	JB51750-22	Thallium	< 0.53	10	< 5.3	3
Units – mg/Kg < - The analyte was analyzed for, but was not detected above the stated reporting limit. NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.						

The interpretation of the thallium result (<5.3) in JB51750-22 was not significantly compromised by the applied dilution or raised reporting limits, because the nickel concentration in this sample was above the SRS of 31 mg/Kg and, thus, this sample is potentially subject to some sort of response action or further evaluation.

Summary of Metals Analysis

The soil sample analytical results for the samples of SDG JB51750 were found to be compliant with the analytical methods for the analysis of metals in the 22 soil samples and two field blanks using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the matrix spike recoveries above or below QC limits, and differences in the serial dilution analysis, as summarized in Tables 2 and 3. The individual associated sample results are qualified accordingly and listed in Table 6 below. Sample analyte results are flagged with either "NJ-", "NJ+", "EJ", or "ENJ+".

The QC criteria were met for all ICP target analyte analyses, except for the low matrix spike recoveries for antimony in both soil matrix QC batches and elevated MS recoveries for chromium in both QC batches with elevated MS/MSD recoveries for vanadium in QC Batch MP26327. The soil samples collected October 30 and 31, 2013 are qualified as estimated values for antimony ("NJ-"), chromium ("NJ+" or "ENJ+"), and vanadium (flagged "NJ+" or "EJ") in the associated soil samples due to a potential low or high bias, as summarized in Table 2 and individually listed below in Table 6, or for potential variability in the reported concentrations due to the presence of some interference in the sample matrix (those results flagged with an "E"), as summarized above in Table 3.

Table 6. Summary Qualified Sample Metals Results in SDG JB51750

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
GD010 4.5-5	JB51750-1	Antimony	1.4	NJ-
GD010 8-8.5	JB51750-2	Antimony	< 0.93	NJ-
GD010 8-8.5	JB51750-2	Chromium	24.5	ENJ+
GD010 8-8.5	JB51750-2	Nickel	57.7	EJ
GD010 8-8.5	JB51750-2	Vanadium	10.7	EJ
GD010 9-9.5	JB51750-3	Antimony	< 0.95	NJ-
GD010 9-9.5	JB51750-3	Chromium	60.0	ENJ+
GD010 9-9.5	JB51750-3	Nickel	34.8	EJ
GD010 9-9.5	JB51750-3	Vanadium	11.2	EJ
GD010 10-10.5	JB51750-4	Antimony	< 0.98	NJ-
GD010 10-10.5	JB51750-4	Chromium	28.7	ENJ+
GD010 10-10.5	JB51750-4	Nickel	69.9	EJ
GD010 10-10.5	JB51750-4	Vanadium	29.8	EJ
GD010 11-11.5	JB51750-5	Antimony	< 1.8	NJ-
GD010 11-11.5	JB51750-5	Chromium	23.8	ENJ+
GD010 11-11.5	JB51750-5	Nickel	15.5	EJ
GD010 11-11.5	JB51750-5	Vanadium	40.6	EJ
GD009 8-8.5	JB51750-7	Antimony	< 0.94	NJ-
GD009 8-8.5	JB51750-7	Chromium	43.3	ENJ+
GD009 8-8.5	JB51750-7	Nickel	52.1	EJ
GD009 8-8.5	JB51750-7	Vanadium	10.0	EJ
GD006 6-6.5	JB51750-10	Antimony	11.3	NJ-
GD006 6-6.5	JB51750-10	Chromium	1,500	ENJ+
GD006 6-6.5	JB51750-10	Nickel	31.4	EJ
GD006 6-6.5	JB51750-10	Vanadium	25.9	EJ
GD006 7-7.5	JB51750-11	Antimony	< 0.86	NJ-
GD006 7-7.5	JB51750-11	Chromium	122	ENJ+
GD006 7-7.5	JB51750-11	Nickel	27.5	EJ
GD006 7-7.5	JB51750-11	Vanadium	14.9	EJ
GD006 8-8.5	JB51750-12	Antimony	< 0.89	NJ-

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
GD006 8-8.5	JB51750-12	Chromium	12.4	ENJ+
GD006 8-8.5	JB51750-12	Nickel	33.5	EJ
GD006 8-8.5	JB51750-12	Vanadium	11.6	EJ
GD006 9-9.5	JB51750-13	Antimony	< 0.91	NJ-
GD006 9-9.5	JB51750-13	Chromium	18.4	ENJ+
GD006 9-9.5	JB51750-13	Nickel	31.6	EJ
GD006 9-9.5	JB51750-13	Vanadium	10.4	EJ
DUP 02	JB51750-14	Antimony	< 0.93	NJ-
DUP 02	JB51750-14	Chromium	45.5	ENJ+
DUP 02	JB51750-14	Nickel	27.5	EJ
DUP 02	JB51750-14	Vanadium	14.3	EJ
GD005 6-6.5	JB51750-16	Antimony	< 4.3	NJ-
GD005 6-6.5	JB51750-16	Chromium	206	NJ+
GD005 6-6.5	JB51750-16	Vanadium	26.0	NJ+
GD005 7-7.5	JB51750-17	Antimony	< 4.1	NJ-
GD005 7-7.5	JB51750-17	Chromium	30.6	NJ+
GD005 7-7.5	JB51750-17	Vanadium	18.2	NJ+
GD005 8-8.5	JB51750-18	Antimony	< 3.5	NJ-
GD005 8-8.5	JB51750-18	Chromium	54.0	NJ+
GD005 8-8.5	JB51750-18	Vanadium	17.3	NJ+

GD005 9-9.5	JB51750-19	Chromium	20.0	NJ+
GD005 9-9.5	JB51750-19	Vanadium	22.0	NJ+
DUP 03	JB51750-20	Antimony	< 4.6	NJ-
DUP 03	JB51750-20	Chromium	28.7	NJ+
DUP 03	JB51750-20	Vanadium	18.8	NJ+
GD007 5.5-6	JB51750-22	Antimony	11.1	NJ-
GD007 5.5-6	JB51750-22	Chromium	1,240	NJ+
GD007 5.5-6	JB51750-22	Vanadium	< 26	N
GD007 6.5-7	JB51750-23	Antimony	< 4.8	NJ-
GD007 6.5-7	JB51750-23	Chromium	64.8	NJ+
GD007 6.5-7	JB51750-23	Vanadium	21.1	NJ+
GD007 7.5-8	JB51750-24	Antimony	< 4.9	NJ-
GD007 7.5-8	JB51750-24	Chromium	43.7	NJ+
GD007 7.5-8	JB51750-24	Vanadium	19.9	NJ+
GD007 8.5-9	JB51750-25	Antimony	< 4.5	NJ-
GD007 8.5-9	JB51750-25	Chromium	28.4	NJ+
GD007 8.5-9	JB51750-25	Vanadium	20.0	NJ+
GD008 6-6.5	JB51750-27	Antimony	< 4.8	NJ-
GD008 6-6.5	JB51750-27	Chromium	177	NJ+
GD008 6-6.5	JB51750-27	Vanadium	27.5	NJ+
GD008 7-7.5	JB51750-28	Antimony	< 5.0	NJ-
GD008 7-7.5	JB51750-28	Chromium	102	NJ+
GD008 7-7.5	JB51750-28	Vanadium	23.7	NJ+

Key:

- < – The analyte was analyzed for, but was not detected above the stated reporting limit.
- N – The matrix spike sample recovery in the associated QC sample is not within QC limits.
- J – Indicates an estimated value.
- J+ – The result is an estimated value, but the result may be biased high.
- J- – The result is an estimated value, but the result may be biased low.
- E – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one QC batch for the single field blank.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Field Duplicate Sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

Hexavalent chromium was detected in nineteen of the 21 soil samples analyzed for hexavalent chromium, with three concentrations exceeding the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries, except for the low soluble MS recovery in QC Batch GP75798.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values all exceeding 0.99989, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 96.0% to 100.1% for the two QC batches associated with the 21 soil samples, and 99.5% to 99.7% for the QC batch associated with the two field blank samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L), or the field blanks. Thus, no sample results are affected or qualified for any potential QC blank contamination. Hexavalent chromium was not detected in the field blanks at a reporting limit of 0.010 mg/L.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, except for the soluble MS recovery for JB51750-2 in QC Batch GP75798, as noted in Table 7. The 68.2% soluble matrix spike recovery for hexavalent chromium was below the QC limits of 75-125% for batch QC Sample JB51750-2 in QC Batch GP75798, which indicates possible matrix interference. All other matrix spike recoveries were within the respective QC limits.

Table 7. Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP75798 E	JB51750-2	Cr ⁺⁶ , soluble	68.2 %	NJ-	Low

GP75798 £	JB51750-2	Cr ⁺⁶ , insoluble	96.2 %	----	----
GP75798 £	JB51750-2	Cr ⁺⁶ , post spike	92.2 %	----	----
GP75802 §	JB51750-23	Cr ⁺⁶ , soluble	80.5 %	----	----
GP75802 §	JB51750-23	Cr ⁺⁶ , insoluble	104.3 %	---	----
GP75802 §	JB51750-23	Cr ⁺⁶ , post spike	102 %	---	---
GN94224 Θ	JB51770-1	Cr ⁺⁶ , soluble	103.8 %	----	----

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike.
 £ – The samples associated with QC Batch GP75798 consist of JB51750-2 through -5, JB51750-7, JB51750-10 through -14 (inclusive).
 § – The samples associated with QC Batch GP75802 consist of JB51750-16 through -20, JB51750-22 through -25, JB51750-27, and JB51750-28.
 Θ – The samples associated with QC Batch GN94224 consist of field blanks JB51750-29 and -30.

The soluble MS recovery of 68.2% was below QC limits for Cr⁺⁶ for the spiked sample from sampling location GD010 8-8.5 in the soil sample analysis in QC Batch GP75798 which was associated with 10 soil samples with lab sample IDs of JB51750-2 through -5, JB51750-7, JB51750-10 through -14 (inclusive).

Applying the DV guidelines that are based on SW-846 Method 7196A (NJDEP, 2005), the hexavalent chromium results for the associated ten soil samples are, consequently, qualified as estimated values and flagged with “NJ-” due to the potential low bias in the ability to recover this analyte in the soil matrix. These qualified results are presented below in Table 9.

Duplicate Sample Analysis

All duplicate analyses met QC requirements with values less than 12.6 %RPD, including Cr+6, redox potential and pH analyses, except for the 24.6%RPD for the duplicate analysis associated with the field blanks. Although the 24.5%RPD for Cr⁺⁶ was above the laboratory QC limit for the duplicate analysis of the non-client sample JB51770-1 in GN94224, the value is Acceptable because of the low sample concentrations which differ by less than the DV QC guideline of > CRQL (USEPA, 2010; USEPA, 2006) when sample concentrations are low (< 5 × RL). Consequently, no sample results associated with this SDG, SDG JB51750, are subject to qualification for analytical precision issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries between 86.1% and 97.3% for the soil sample analyses, and 106.7% for the analysis associated with the field blanks, thereby demonstrating acceptable analytical system performance.

Field Duplicate Analysis

The results for the analysis of the two pairs of field duplicate samples are presented in Table 8, below. It is evident that the results of the detected results of sample GD005 9-9.5 and its field duplicate (1.2 and 1.1 mg/Kg) were almost identical, thereby meeting the QC limit of < 2 × CRQL when sample concentrations are below five times the reporting limit. The detected results for the field duplicate samples from GD005 9-9.5 are very similar and, thus, considered representative.

The results of the detected Cr+6 concentration (1.6 mg/Kg) in GD007 8.5-9 and the non-detect result (< 0.49 mg/Kg) of DUP 03 exhibited a difference of >2 × CRQL and, thus, are subject to qualification as estimated values and are to be flagged with “J” in Table 8 below.

Table 8. Comparison of Field Duplicate Soil Sample Results.

Analyte	GD005 9-9.5 (mg/Kg)	DUP 02 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	1.2	1.1 NJ-	< 2 × CRQL	-
Analyte	GD007 8.5-9 (mg/Kg)	DUP 03 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	1.6	< 0.49	> 2 × CRQL	J

< – The analyte was not detected at the stated reporting limit
 NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is not within QC limits; possible low bias.
 J – The reported result is an estimated value.
 CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit.
 < 2 × CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.

Serial Dilution Analysis

No serial dilution analysis was performed in either of the two QC batches. This is not a required analysis of the method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$Cr^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

- Where:
- A = conc. from calibration curve (mg/L)
 - B = Final digested volume (L)
 - C = Wet wt of sample (Kg)
 - D = % Solids/100
 - E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample GD006 6-6.5 (JB51750-10) was listed as 110 mg/Kg on the reporting form and 0.4604 mg/L on the quantitation report in the raw data for a 5-fold dilution analysis. A calculation check provides the following result:

$$Cr^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$Cr^{+6} \text{ (mg/Kg)} = \frac{0.4604 \text{ mg/L} \times 0.1 \text{ L} \times 5}{0.00241 \text{ Kg} \times 87.0/100} = \frac{0.2302}{0.0020967} = 109.7915 \text{ mg/Kg}$$

$$Cr^{+6} \text{ (mg/Kg)} = 110 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 110 mg/Kg for Sample GD006 6-6.5 was correctly reported. This was the highest detected Cr+6

concentration detected among the 21 soil samples of this SDG, JB51750 analyzed for hexavalent chromium. This was one of three detected Cr+6 concentrations result above the SRS of 20 mg/Kg. All remaining Cr+6 concentrations were below 11.2 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No other disparities relative to the reported values and characteristics were observed. All results met the QC limits, such that no pH or redox potential (ORP) results are subject to qualification.

All of the 21 soil samples fell below the Eh-pH phase diagram line. These results suggest that all of the samples experience conditions of a “reducing” soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase.

Summary of Cr+6 Analysis

Due to the low MS recovery for the soluble spike in QC Batch GP75798 associated with 10 soil samples, the Cr⁺⁶ results in the associated 10 soil samples are qualified as estimated values and flagged with “NJ-” due to a low soluble MS recovery. The hexavalent chromium results for the two field duplicate samples from GD007 8.5-9 were qualified as estimated values and flagged with “J” because the difference between these results differed by more than the QC limit for sampling representativeness. No other Cr+6 results were subject to qualification in the hexavalent chromium analyses, or the pH, redox potential or total solids analyses. The qualified Cr+6 results following the DV review are presented below in Table 9.

Table 9. Summary of Qualified Sample Hexavalent Chromium Results for SDG JB51750

Sample	Client ID	Analyte	Result (mg/Kg)	DV Qualifier
GD010 8-8.5	JB51750-2	Hexavalent chromium	5.0	NJ-
GD010 9-9.5	JB51750-3	Hexavalent chromium	41.5	NJ-
GD010 10-10.5	JB51750-4	Hexavalent chromium	6.1	NJ-
GD010 11-11.5	JB51750-5	Hexavalent chromium	< 0.44	NJ-
GD009 8-8.5	JB51750-7	Hexavalent chromium	11.2	NJ-
GD006 6-6.5	JB51750-10	Hexavalent chromium	110	NJ-
GD006 7-7.5	JB51750-11	Hexavalent chromium	96.4	NJ-
GD006 8-8.5	JB51750-12	Hexavalent chromium	4.3	NJ-
GD006 9-9.5	JB51750-13	Hexavalent chromium	7.5	NJ-
DUP 02	JB51750-14	Hexavalent chromium	1.1	NJ-
DUP 03	JB51750-20	Hexavalent chromium	< 0.49	J
GD007 8.5-9	JB51750-25	Hexavalent chromium	1.6	J

< – The analyte was analyzed for, but not detected at the specified reporting limit.
 NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is not within QC limits; possible low bias.
 J – The reported result is an estimated value.

Other than qualifying the Cr⁺⁶ results in the ten soil samples with “NJ-” due to a low soluble MS recovery and the two field duplicate sample results, no other Cr+6 results were subject to qualification in the hexavalent chromium analyses in samples of SDG JB51750.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
EJ	The reported value is estimated because of the presence of interference.

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 51750

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why. *Matrix interference for metals*

analysis of high Cr⁺⁶ concentrations above calibration range.
 (2x) JB 51750 - 5; (10x) JB 51750 - 10, 22.
 (4x) JB 51750 - 16, 17, 18, 19, 20.
 (5x) JB 51750 - 23, 24, 25, 27, 28; Cr⁺⁶ (5x) JB 51750 - 10, 11.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

*Antimony in JB 51750-10
 Thallium in JB 51750-22*

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

*Fifteen nickel: JB 51750 - 2, 3, 4, 7, 10, 12, 13, 16, 17, 18, 19, 22, 23, 24, 28.
 One antimony: JB 51750-22
 Three Cr⁺⁶: JB 51750-3, 10, 11.*

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No analytical procedural problems were noted.

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, 7 and 8 for details.

Qualified sample results are presented in tables 6 and 9 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB51908
Sample Date: October 31 and November 1, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewers: Faiza M. Botros
Janis V. Giga, Ph.D., REP 5554
Report Date: February 6, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-seven (27) soil samples and one (1) Field Blank collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on October 31 and November 01, 2013 for sample delivery group (SDG) JB51908. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB51908 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 27 collected soil samples and one Field Blank aqueous sample.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB51908-2 through -13 (inclusive), JB51908-16 through -19, -21 through -25, JB51908-27 through -29, and JB51908-32 through -34 (inclusive);
- Chromium (ENJ-) in Samples JB51908-2 through -13 (inclusive), JB51908-16 through -19, and JB51908-21 through -23 (inclusive);
- Chromium (EJ) in Samples JB51908-24 through -25, JB51908-27 through -29, and JB51908-32 through -34 (inclusive);
- Nickel (EJ) in Samples JB51908-2 through -13 (inclusive), JB51908-16 through -19, -21 through -25, JB51908-27 through -29, and JB51908-32 through -34 (inclusive);
- Vanadium (ENJ-) in Samples JB51908-2 through -13 (inclusive), JB51908-16 through -19, and JB51908-21 through -23 (inclusive);

No other sample results in SDG JB51908 required qualification, including the hexavalent chromium results, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. All but two reported Cr+6 concentrations were below the respective site remediation standard (SRS) limits, while 18 nickel and one vanadium result exceeded the respective SRS value.

The individual sample results that were qualified following the DV review are identified in Table 6 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The twenty-seven (27) soil and one (1) Field Blank samples collected on October 31 and November 01, 2013, were received November 1, 2013 at the Accutest laboratory in Dayton, NJ intact and chemically preserved with acceptable sampling cooler temperatures of 4.6°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. in Orlando Florida on November 6, 2013 properly preserved and intact with sampling cooler temperatures of 2.8°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Client Sample Designation	Sample Lab ID Number	Date Collected	Matrix	Analyses
GD004 5.5-6	JB51908-2	10/31/13	Soil	Metals, Cr ⁺⁶
GD004 6.5-7	JB51908-3	10/31/13	Soil	Metals, Cr ⁺⁶
GD004 7.5-8	JB51908-4	10/31/13	Soil	Metals, Cr ⁺⁶
GD002 0"-6"	JB51908-5	10/31/13	Soil	Metals, Cr ⁺⁶
GD002 2-2.5	JB51908-6	10/31/13	Soil	Metals, Cr ⁺⁶
GD002 4-4.5	JB51908-7	10/31/13	Soil	Metals, Cr ⁺⁶

FB 04	JB51908-35	11/01/13	Aqueous	Metals, Cr ⁺⁶
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast in Orlando FL;				
Cr ⁺⁶ – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

Data Review

Data, as presented in the analytical data package SDG JB51908, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgment, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) "*National Functional Guidelines for Inorganic Data Review*", OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Eighteen (18) nickel concentrations and one vanadium results exceeded the respective site remediation standard (SRS) levels of the 27 soil samples of this SDG.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) recoveries for antimony, chromium and vanadium were outside control limits, while the and matrix spike duplicate (MSD) recoveries for antimony and chromium were identified as being outside QC limits in QC Batch MP26337 and the MS/MSD recoveries for antimony were outside QC limits for MP26338. The case narrative identified antimony as having an MS recovery outside QC limits and antimony and chromium outside QC limits in the MSD analysis. However, the chromium recovery of 122% was within DV QC limits of 75-125% (NJDEP, 2002).

The case narrative identified the serial dilution results being outside QC limits in QC Batch MP26337 for antimony, chromium, nickel and vanadium and stated that the percent difference was acceptable due to low initial sample concentration (< 50 times IDL). This statement conflicted with other statements indicating that the serial dilution results for chromium, nickel, and vanadium indicate possible matrix interference. Apparently this statement should only be applied for antimony. Similar conflicting statements were made regarding the serial dilution results for QC Batch MP26338 for antimony, chromium and nickel. Elevated reporting limits were listed in the case narrative for most analytes in many samples.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all inductively coupled argon plasma emission spectrometer (ICP)-analyzed samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

The QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There were, however, a few exceptions.

There were several samples whose internal standard (IS#2) area count was above the identified QC limits in analytical sequence MA11209 and one sample in MA11205. Internal standard IS#2 is associated with chromium and vanadium. In the analytical sequence MA11205, the area count for IS #2 in JB51908-27 was identified as being outside QC limits on the QC summary report, while samples JB51908-11, -21, -22, and -23 in MA11209 exceeded the listed QC range of 60-125%. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Review of the data revealed that the area counts for IS#2 (ranging 125%-129%) in each of these samples were actually within the updated QC limits of 70-130%. Thus, these samples did not warrant reanalysis and the results for chromium and vanadium are considered acceptable. Consequently, the affected samples in MA11205 and MA11209 were not reanalyzed, as the IS area counts are considered acceptable by the laboratory. Consequently, no soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB51908.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were below QC limits of 75 - 125% for QC samples in the two identified QC batches associated with the 27 soil samples which are summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. The MS/MSD recoveries for chromium and the MS recovery for vanadium were also below QC limits in QC Batch MP26337. Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential or low bias in the ability to recover these analytes in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26337 Ω	JB51908-2	Antimony	20.2 %	16.4 %	NJ-	Low
MP26337 Ω	JB51908-2	Chromium	39.8 %	30.4 %	NJ-	Low
MP26337 Ω	JB51908-2	Vanadium	65.9 %	80.0 %	NJ-	Low
MP26338 †	FA9803-1	Antimony	57.4 %	52.0 %	NJ-	Low

QC Limits are 75-125%;
NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
MS – Matrix spike
MSD – Matrix spike duplicate.
Ω – The samples associated with QC Batch MP26337 consist of JB51908-2 through -13, JB51908-16 through -19, and JB51908-21 through -23 (inclusive);
† – The samples associated with QC Batch MP26338 consist of JB51908-24, -25, JB51908-27 through -29, JB51908-32 through -34 (inclusive).

The antimony results in all of these affected samples are flagged with "NJ-" due to a potential low bias, as were the chromium and vanadium results in samples associated with QC Batch MP26337. These qualified results are presented below in summary table, Table 6, together with the results qualified for serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on two soil samples and one aqueous sample with those samples also spiked in duplicate as a means of assessing the analytical precision. All %RPD values were below the QC limit of 35%RPD for soils and 20%RPD for aqueous samples, except for the 200%RPD results in the aqueous QC sample. However, the difference did meet the < CRQL QC limit for low concentration samples. Otherwise, the soil %RPD values were less than 10.5%RPD (with a 29.2%RPD value for one antimony result), and 0 to 4.4%RPD for the remaining aqueous results and no results required qualification. The duplicate analyses demonstrated very good analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 91.8% - 104.0% for the soil sample metals analysis, and 94.5 – 101.8% for the aqueous blank spike.

Serial Dilution Analysis (QC Limit $\leq 10\%$ D)

The case narrative stated that the RPDs for antimony, chromium, nickel and vanadium are outside QC limits in QC Batch MP26337, and for antimony, chromium and nickel in MP26338, but that the percent difference values were acceptable due to the low initial sample concentration (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010). However, these two statements were not correct, since the respective initial concentrations for chromium, nickel and vanadium were clearly above the $50 \times$ IDL criterion and are, thus, subject to qualification, as identified below in Table 3. The case narrative also mentioned that the serial dilution results for chromium, nickel and vanadium indicate possible matrix interference.

Table 3. Serial Dilution Results Above QC Limits – SDG JB51908

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26337 Ω	JB51908-2	Chromium	28.8 %D	EJ
MP26337 Ω	JB51908-2	Nickel	27.0 %D	EJ
MP26337 Ω	JB51908-2	Vanadium	26.3 %D	EJ
MP26338 \dagger	FA9803-1	Chromium	11.6 %D	EJ
MP26338 \dagger	FA9803-1	Nickel	14.1 %D	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Note –
 Ω – The samples associated with QC Batch MP26337 consist of JB51908-2 through -13, JB51908-16 through -19, and JB51908-21 through -23 (inclusive);
 \dagger – The samples associated with QC Batch MP26338 consist of JB51908-24, -25, JB51908-27 through -29, JB51908-32 through -34 (inclusive).

The associated chromium and nickel results in samples with laboratory sample ID numbers ranging JB51908-2 through -13, -16 through -19, -21 through -25, -27 through -29, and JB51908-32 through -34, inclusive, are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The vanadium results in samples JB51908-2 through -13, JB51908-16 through -19, and JB51908-21 through -23 (inclusive) are also subject to be flagged with “EJ”. The individual qualified sample results are presented in the summary table, Table 6, along with the results qualified for matrix spike recoveries below QC limits identified in Table 2 above.

Field Duplicate Sample Analysis (QC Limit $\leq 50\%$ RPD)

One set of field duplicate samples were collected from sampling location ED009 6-6.5 as part of SDG JB51908. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or $> 2 \times$ CRQL

(USEPA, 2012), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of this one pair of field duplicate samples are presented in Table 4, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples were very similar for all five analytes analyzed and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 32 %RPD or differed by less than two times the reporting limit value ($< 2 \times \text{CRQL}$) for all analyte pairs. Soil sample non-homogeneity may have contributed to any observed disparities.

Table 4. Comparison of Field Duplicate Soil Sample Results – SDG JB51908

Analyte	ED009 6-6.5 (mg/Kg)	DUP 04 (mg/Kg)	% RPD	DV Flag
Antimony	< 4.0 NJ-	< 3.4 NJ-	< 2 × CRQL	-
Chromium	394 ENJ-	287 ENJ-	31.4 %	-
Nickel	36.7 EJ	36.9 EJ	0.5 %	-
Thallium	< 1.0	< 0.87	< 2 × CRQL	-
Vanadium	14.7 ENJ-	16.1 ENJ-	9.1 %	-
<p>< – The analyte was not detected at the stated reporting limit; J – The reported result is an estimated value; NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low; E – The serial dilution result is outside control limits; indeterminate bias direction; EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction; CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit; < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.</p>				

Consequently, the field duplicate results in this pair of field duplicate samples demonstrated very good sampling representativeness and precision, with results generally less than 10%RPD, except for the 31%RPD for chromium, which is still well within QC limits.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported vanadium results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times \text{TS}/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The vanadium concentration for Sample ED012 8.5-9 (JB51908-32) was listed as 102 mg/Kg on the reporting form and 2.291 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Vanadium (mg/Kg)} = \frac{(2,291 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.28 \text{ g}) (87.8/100\%)} = 101.9274 \mu\text{g/g}$$

$$= 102 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 102 mg/Kg for Sample ED012 8.5-9 was correctly reported. Note that the software incorporates the dilution factor into the mg/L value in the raw data quant report, hence a dilution factor of only one (DF = 1) appears in the equation above, even though the dilution factor was 5x. The dilution factor appears as "Corr. Factor: 5.000" on the quant report.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 22 of the 27 soil samples that had been diluted by a factor of either two, five, or twenty.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where two samples were diluted by a factor of 20x and 5x, thereby raising the reporting limit for the antimony and thallium results above the respective SRS, as presented below in Table 5, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 5. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
ED011 7-7.5	JB51908-28	Antimony	< 0.99	5	< 11 NJ-	6
ED012 9.5-10	JB51908-33	Antimony	< 3	20	< 60 NJ-	6
ED012 9.5-10	JB51908-33	Nickel	< 2.85	20	< 57 EJ	31
ED012 9.5-10	JB51908-33	Thallium	< 0.7	20	< 14	3

Units – mg/Kg

< - The analyte was analyzed for, but was not detected above the stated reporting limit.

NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

The interpretation of the antimony result in JB51908-28 (<11) was not compromised by the applied dilution, because the nickel concentration (38.7 mg/Kg) was above the SRS criterion of 31 mg/Kg and, thus, potentially subject to some sort of response action or further evaluation. However, although the elevated reporting limits for JB51908-33 are rather high, the associated Cr+6 concentration for this sample was very low (0.65 mg/Kg) and considerably below its SRS of 20 mg/Kg.

Metals Analysis Summary

The soil sample analytical results for the samples of SDG JB51908 were found to be compliant with the analytical methods for the analysis of metals in the twenty-seven soil samples and one field blank using SW-846 Method 6010C.

Several matrix spike recoveries in the QC samples were outside QC limits, such that the antimony results in all soil samples are qualified due to a potential low bias (NJ-), while the detected nickel and vanadium results are qualified as estimated values due to a potential low bias in the associated samples (flagged NJ-), as summarized in Table 2 and detailed in Table 6.

The serial dilution results for chromium, nickel and vanadium in the QC sample of QC Batch MP26337 were above the QC limit of 10.0 %D, suggesting potential variability in the reported results due to the presence of interference in the matrix. The identified chromium and nickel sample results are qualified as estimated values and are flagged with "EJ" in eight soil samples, as presented below in Table 6, as were the nickel results in 19 soil samples, while the chromium and vanadium results in the 19 soil samples are also flagged for the low matrix spike recoveries (thus, flagged with "ENJ-").

Table 6. Summary Qualified Sample Metals Results in SDG JB51908

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.

J – The reported result is an estimated value;

NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low;

E – The serial dilution result is outside control limits; indeterminate bias direction;

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one QC batch for Field Blank sample.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|---------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ Quantitation checks | Field duplicate sample analysis |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in 17 of 27 soil samples analyzed in SDG JB51908. Cr⁺⁶ results had exceeded the SRS of 20 mg/Kg in two (2) soil samples.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values exceeding 0.9998, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 91.6% to 99.9% for the two QC batches associated with the 27 soil samples and one Field Blank, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in any of the method blanks (< 0.40 mg/Kg or 0.010 mg/L), any of the continuing calibration blanks (< 0.010 mg/L), or the field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 7. No hexavalent chromium results required qualification based on the results of the MS recoveries.

Table 7. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP75830	JB51908-19	Cr ⁺⁶ , soluble	84.7 %	----	----
GP75830	JB51908-19	Cr ⁺⁶ , insoluble	91.5 %	----	----
GP75831	JB51908-3	Cr ⁺⁶ , soluble	88.0 %	----	----
GP75831	JB51908-3	Cr ⁺⁶ , insoluble	86.7 %	----	----
GN94299	JB51824-1	Cr ⁺⁶ , soluble	93.3 %	----	----

QC Limits are 75-125% (soil) and 85-115% (aqueous) for MS recovery; 85-115% for post spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium

Duplicate Sample Analysis

In soil, the 20.8%RPD result for the duplicate Cr⁺⁶ analyses was the highest result observed in the general chemistry set of duplicate analyses. This %RPD value was slightly above the laboratory QC limits of 20%RPD, and below the recommended 35%RPD QC limit for soil samples (USEPA, 2010). However, this %RPD value is also acceptable due to low duplicate and sample concentrations. In the aqueous matrix, the 200%RPD was outside the QC limit of 20% RPD. However, this %RPD value is acceptable due to low duplicate and sample concentrations; the difference was less than the reporting limit. All other duplicate analyses met QC requirements including Cr⁺⁶, redox potential and pH analyses. Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

In soil and aqueous batches, the recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 85.6% to 103.4%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in any of the three analytical sequences. The serial dilution analysis is not a requirement of the analytical method.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

The results for the analysis of the one pair of field duplicate samples from sampling location ED009 6-6.5 are presented in Table 8, below.

Table 8. Comparison of Field Duplicate Soil Sample Results – SDG JB51908

Analyte	ED009 6-6.5 (mg/Kg)	DUP 04 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	6.4	13.6	72.0 %	J
QC Limit is ≤ 50 %RPD; J – The reported result is an estimated value;				

It is apparent that the results for the hexavalent chromium concentrations in the field duplicate samples from location ED009 6-6.5 are disparate and, thus, subject to qualification.

As a result of the disparity in the respective hexavalent chromium results for the field duplicate samples from ED009 6-6.5, these results are subject to qualification and are to be flagged with "J", as indicated in Table 8 above. Even with the observed disparity, which may be attributable to soil sample non-homogeneity, the results were both clearly below the SRS of 20 mg/Kg facilitating the use of these results in project evaluations.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calibration curve (mg/L)
B = Final digested volume (L)
C = Wet wt of sample (Kg)
D = % Solids/100
E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample ED011 6-6.5 (JB51908-27) was listed as 35.9 mg/Kg on the reporting form and 0.7302 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.7302 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00253 \text{ Kg} \times 80.5/100} = \frac{0.07302}{0.0020367} = 35.8530 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 35.9 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 35.9 mg/Kg for Sample ED011 6-6.5 was correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 27 soil samples of this SDG, JB51908. Thus, this detected Cr⁺⁶ concentration was above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

Most samples were observed to fall below the Eh-pH phase diagram line. These results suggest that many of the samples experience conditions of a "reducing" soil environment. Some of the samples (2 out of 27) fall on or slightly above the Eh-pH phase diagram line. These results suggest that some of the samples may experience condition of an oxidizing soil environment. However, the reported Cr⁺⁶ results of the affected samples are considered acceptable because of two issues, one being that the Cr⁺⁶ concentration of the samples in the oxidizing environment are below the SRS (20 mg/Kg). The Cr+6 results of the other samples in the reducing soil are not expected to increase in value because oxidation to Cr⁺⁶ is not favorable under reducing soil conditions. Thus, the hexavalent chromium results are considered acceptable as reported, with the highest hexavalent chromium concentration (35.9 mg/Kg) detected in two different samples above the SRS of 20 mg/Kg, as detailed in the text above, with both samples situated below the Eh-pH line in "reducing" conditions. The detected Cr+6 concentrations of the remaining samples were all below 13.6 mg/Kg.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were within QC limits, as were all other QC results associated with the hexavalent chromium analysis, including the duplicate sample analysis, no Cr⁺⁶ results were qualified following the DV review, except for the two Cr+6 results in the field duplicate samples from location ED009 6-6.5, which are estimated values flagged with "J", as presented below in Table 9.

Table 9. Summary of Qualified Sample Cr⁺⁶ Results in SDG JB51908

Client ID	Laboratory Sample ID	Analyte	Result (mg/Kg)	DV Qualifier
DUP 04	JB51908-22	Cr+6	13.6	J
ED009 6-6.5	JB51908-23	Cr+6	6.4	J
< – The analyte was analyzed for, but not detected at the specified reporting limit. J – The reported result is an estimated value (due to field duplicate sample analysis disparity). The reported sample value is estimated with an indeterminate bias direction.				

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB51908

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? *for metals analysis* Yes No
Indicate the identity of the samples and why. *Matrix interference.*

(2x) JB51908-3, 4, 6-13; 16-19; 21-25.

(5x) JB51908-28, 32

(20x) JB51908-33

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No

If "Yes", list the affected samples.

JB51908-28 (antimony)

JB51908-33 (antimony, nickel, thallium)

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

18 nickel: JB51908-2, 4, 7, 8, 9, 10, 11, 12, 13, 16, 17,

1 vanadium: JB51908-32, 19, 21, 22, 23, 24, 28, 32.

2 Cr+6: JB51908-32

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No problems with analytical procedures were noted.

JB51908

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3 and 8 for details.

Qualified sample results are presented in tables 6 and 9 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB52025/JB52025R/JB52025T
Sample Date: November 4, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
SPLP Leachate Analysis, EPA Method 1312
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: January 29, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-eight (28) soil samples and one (1) field blank (FB) samples collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 4, 2013 for sample delivery group (SDG) JB52025, JB52025R and JB52025T. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB52025 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 28 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB52025-1, JB52025-3 through-7, JB52025-9 through -12, JB52025-14 through -19, JB52025-21 through -24, (inclusive) and JB542025-27;
- Antimony (*NJ-) in Samples JB52025-28 through-32 (inclusive), JB52025-26A;
- Chromium (EJ) and nickel (EJ) in Samples JB52025-1, and JB52025-3 through -5 (inclusive);
- Chromium (ENJ-) in Samples JB52025-28 through -32 (inclusive), JB52025-25A and -26A;
- Nickel (EJ) in Samples JB52025-28 through -32 (inclusive), JB52025-25A;
- Vanadium (EJ) in Samples JB52025-6 and -7, JB52025-9 through -12, JB52025-14 through -19, JB52025-21 through -24, JB52025-27 through -32 (inclusive);
- Nickel (EJ) in the reanalysis of Sample JB52025-19R;
- Antimony (NJ-) in the reanalysis of Sample JB52025-19T;

- Vanadium (EJ) in the reanalysis of Sample JB52025-19T.

No other sample results in SDG JB52025 required qualification. Details are provided in the tables and text below. The sample results that were subject to qualification following the DV review are presented in Tables 7, 10 and 11 of this DV report.

The reported concentrations were below the respective site remediation standard (SRS) limits, except for thirteen nickel results, three vanadium results, one antimony result, and one thallium result. There were seven hexavalent chromium (Cr+6) results above its SRS of 20 mg/Kg. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The twenty-eight (28) soil samples and one field blank collected November 4, 2013, were received the same day at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 3.8°C. The samples destined for metals and SPLP leachate analyses were received at the Accutest Laboratories Southeast, Inc. in Orlando, Florida November 7, 2013 preserved and in good condition with sampling cooler temperatures of 3.4°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary for SDG JB52025

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>

GD012 9.5-10	JB52025-32	11/4/13	Soil	Metals, Cr+6
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories in Dayton, NJ. (Ni = nickel, Sb = antimony)				
Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

The sample with laboratory sample ID number JB52025-19 was incorrectly logged into the laboratory data system as 107_I044 11.2-12. However, the correct client sample number should be, as noted on the chain of custody (COC) forms, 107_I044 11.5-12. The client ID listed on the COC will be used in this DV report to represent this sample.

Data Review

Data, as presented in the analytical data package SDG JB52025, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (✓) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Two soil samples were analyzed for SPLP leachate analysis, one nickel and one antimony analysis, along with the following parameters: weight, dry weight, volume, and pH. Several soil sample results exhibited concentrations above the respective site remediation standard (SRS) in some of the 28 soil samples of this SDG. These included thirteen (13) nickel, three vanadium, one antimony result and one thallium result above the respective SRS values of 31, 78, 6 and 3 mg/Kg, respectively.

Laboratory Case Narrative

The extensive case narrative identified all analytes for the samples that were diluted, listing them individually by analyte in random fashion. Matrix spike and MSD recoveries for antimony were identified as being outside QC limits in QC batches MP26338, MP26344, and MP26347, along with the chromium result being outside QC limits in QC Batch MP26344. The duplicate matrix spike recoveries for antimony were outside QC limits in MP26344. The serial dilution results were outside QC limits for antimony, chromium and nickel in MP26338, chromium, nickel, thallium and vanadium in MP262344, and antimony, chromium, nickel and vanadium in MP26347, but, according to the case narrative, the percent differences were acceptable due to low initial sample concentrations ($< 50 \times \text{IDL}$). This apparently was not always correct, as discussed below. All other QC requirements were met, including analyses for pH, oxidation reduction potential, total solids, and the leachate analyses. Details are discussed in the sections below. The metals analyses were performed at the Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the internal standard (IS) area counts identified below.

There were several samples whose IS area counts were above the QC limits of 60-125% identified in the data package for Run number MA11205. Internal standard #2 (IS#2) is associated with chromium and vanadium, while IS#1 is associated with antimony. IS#2 (Cr and V) was out for samples JB52025 -9, -16, -17, -21, -23, while IS#1 (Sb) and #2 (Cr, V) were out for JB512025-12. Samples -9 and -16 were re-analyzed at a dilution that had acceptable IS recoveries. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Applying these revised QC limits, the IS recoveries for samples JB52025-17 and -23 and the IS#1 result for -12 are thereby considered acceptable and did not warrant re-analysis. The vanadium results for samples JB52025-12 and -21 are qualified as estimated values and flagged with "EJ"

due to the serial dilution analysis, leaving only the chromium results for these two samples in question. However, considering that there is no requirement for assessing IS results in Method 6010C (USEPA, 1997) with no DV guidance (NJDEP, 2002) and, the fact that the chromium concentrations in these two samples are orders of magnitude less than the chromium SRS of 120,000 mg/Kg, professional judgement was applied in not qualifying the chromium results in these two remaining samples.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB52025.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were outside QC limits of 75 - 125% for QC samples in the three identified QC batches associated with the soil samples which are summarized in Table 2 below. The chromium MSD recovery in QC Batch MP26344 was also below QC limits, as presented below in Table 2. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Following the DV review, the antimony sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential low bias in the ability to recover these affected analytes in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The chromium results associated with QC Batch MP26344 were also qualified as estimated values and flagged with "NJ-" due to a potential low bias. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26338 Ω	FA9803-1	Antimony	57.4 %	52.0 %	NJ-	Low
MP26344 †	JB52031-1	Antimony	53.1 %	47.0 %	NJ-	Low
MP26344 †	JB52031-1	Chromium	89.9 %	60.1 %	NJ-	Low
MP26347 #	FA9959-1	Antimony	73.6 %	74.4 %	NJ-	Low

QC Limits are 75-125%;
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate.
 Ω – The samples associated with QC Batch MP26338 consist of JB52025-1, -3, -4, and -5;
 † – The samples associated with QC Batch MP26344 consist of JB52025-28 through -32 (inclusive), JB52025-25A, and JB52025-26A;
 # – The samples associated with QC Batch MP26347 consist of JB52025-6, JB52025-7, JB52025-9 through -12, JB52025-14 through -19, JB52025-21 through -24, and JB52025-27.

The antimony results in all of these affected samples are flagged with "NJ-" due to a potential low bias, while the chromium results flagged with "NJ-" in those samples associated with QC Batch MP26344. These qualified results are presented below in summary table, Table 7, together with the results qualified for the spiked duplicate and serial dilution analyses results.

A possible explanation for the low spike recoveries of antimony in each of the three soil sample batches may be due to problems with the procedure, as it has been noted in the literature that the use of USEPA Methods 3020 and 3050 may be inappropriate for the effective analysis of some metals, including antimony and chromium (Smith, 1999).

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on three samples analyzed in duplicate, and three pairs of spiked duplicate samples as a means of assessing the analytical precision.

The case narrative stated that the RPD(s) for MSD for antimony, chromium, nickel, thallium, and vanadium were outside QC limits in QC Batch MP26344 due to possible sample non-homogeneity. However, all %RPD values for the spiked duplicate sample pairs were below the DV guideline of 35%RPD, except for antimony (36.4%RPD), as presented below in Table 3. All remaining duplicate and spiked duplicate results were below the applied QC limit of 35%RPD or < 2 ×CRQL (USEPA, 2010). Thus, the antimony results associated with QC Batch MP26344 are qualified as estimated values and are to be flagged with "*J" due to the potential variability in the analytical precision, though without exhibiting any clear bias direction. When the "*J" qualifiers are combined with the qualifiers associated with the low antimony MS/MSD recoveries in the QC sample of this batch, the antimony results appear with "*NJ-" in the summary table, Table 7.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
MP26344 †	JB52031-1	Antimony	36.4 %RPD	*J
QC Limit is 35%RPD; * – Duplicate analysis not within control limits; indeterminate bias direction. J – The reported result is an estimated value. † – The samples associated with QC Batch MP26344 consist of JB52025-28 through -32 (inclusive), JB52025-25A, and JB52025-26A;				

Aside from the antimony results in QC Batch MP26344, the remaining duplicate analyses demonstrated acceptable analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 98.1% - 107.0% for the soil sample metals analysis, 94.5% to 101.8% for the aqueous batch and 92-100% for the leachate analyses.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The serial dilution results were outside QC limits for chromium and nickel in MP26338, chromium, nickel and vanadium in MP262344, and vanadium in MP26347 where the differences were probably due to sample non-homogeneity. These results are summarized below in Table 4.

Table 4. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26338 Ω	FA9803-1	Chromium	11.6 %D	EJ
MP26338 Ω	FA9803-1	Nickel	14.1 %D	EJ
MP26344 †	JB5203-1	Chromium	17.1 %D	EJ
MP26344 †	JB5203-1	Nickel	42.7 %D	EJ
MP26344 †	JB5203-1	Vanadium	38.9 %D	EJ
MP26347 #	FA9959-1	Vanadium	13.9 %D	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Ω – The samples associated with QC Batch MP26338 consist of JB52025-1, -3, -4, and -5;
† – The samples associated with QC Batch MP26344 consist of JB52025-28 through -32 (inclusive), JB52025-25A, and JB52025-26A;
– The samples associated with QC Batch MP26347 consist of JB52025-6, JB52025-7, JB52025-9 through -12, JB52025-14 through -19, JB52025-21 through -24, and JB52025-27.

The case narrative had stated that the RPD for antimony, chromium and nickel were outside QC limits in QC Batch MP26338, but that the percent difference values were acceptable due to the low initial sample concentration (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010). However, inspection of the data revealed that this statement applied only to antimony, because the initial concentrations of chromium and nickel in the QC sample were, in fact, above the 50 × IDL criterion. Consequently, the chromium and nickel results in the associated samples of QC Batch MP26338 were qualified as estimated values and flagged with “EJ”, as presented below in the summary table, Table 7. Although the case narrative stated that chromium, nickel, thallium and vanadium in MP262344, and antimony, chromium, nickel and vanadium in MP26347 were acceptable due to low initial concentrations, actual data review revealed that the following analytes were actually subject to qualification following the DV review. The chromium, nickel and vanadium samples associated with QC Batch MP26344, and the vanadium results in samples associated with QC Batch MP26347 were also flagged with “EJ”. Because the chromium MSD recovery in MP26344 was below QC limits, the chromium results associated with this QC batch are actually flagged with “ENJ-” in combining both qualifications in order to avoid redundancy in Table 7.

The results qualified for serial dilution results are qualified as estimated values due to potential variability affected by the presence of some type of matrix interference, without any determinate bias direction.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

Two sets of field duplicate samples were collected as part of SDG JB52025. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2010), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of the two pairs of field duplicate samples are presented in Table 5, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples were very similar in one of the two pairs of samples analyzed and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 22 %RPD or differed by less than two times the reporting limit value ($< 2 \times \text{CRQL}$) for all analyte pairs, except for the nickel and vanadium results for the field duplicates from GD012 0"-6". Soil sample non-homogeneity may have contributed somewhat to the observed disparities, as well as the serial dilution results for nickel. The difference between the vanadium results in this sample pair (51.4%RPD) is just marginally above the QC limit of 50%RPD.

Table 5. Comparison of Field Duplicate Soil Sample Results – SDG JB52025

Analyte	GD012 0"-6" (mg/Kg)	DUP 06 (mg/Kg)	% RPD	DV Flag
Antimony	< 0.90 *NJ-	< 0.76 NJ-	< 2 × CRQL	-
Chromium	9.7 ENJ-	7.8 EJ	21.7 %	-
Nickel	12.2 EJ	27.4 EJ	76.8 %	(J)
Thallium	< 0.45	< 3.8	< 2 × CRQL	-
Vanadium	22.1 EJ	37.4	51.4 %	J
Analyte	GD014 9-9.5 (mg/Kg)	DUP 07 (mg/Kg)	% RPD	DV Flag
Antimony	< 1.2 NJ-	< 0.99 NJ-	< 2 × CRQL	-
Chromium	5.1	6.1	17.8 %	-
Nickel	13.3	12.3	7.8 %	-
Thallium	< 0.62	< 0.50	< 2 × CRQL	-
Vanadium	10.6 EJ	8.7 EJ	19.7 %	-

< – The analyte was not detected at the stated reporting limit.
 J – The reported result is an estimated value.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
 *J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction.
 EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
 (J) – Sample result is subject to DV qualification, but not additionally flagged with "J" to avoid redundancy of qualifiers.
 CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit.
 $< 2 \times \text{CRQL}$ – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

Consequently, due to the disparity in the respective detected nickel and vanadium results for the field duplicate samples from GD012 0"-6", these results are to be qualified and flagged with "J", as indicated in Table 5 above. However, the nickel results from the field duplicates of GD012 0"-6" are already qualified and flagged with "EJ", as is the vanadium result for this sample. Consequently, these three results were not further flagged with "J" in an effort to avoid redundancy in the applied qualifiers, thereby leaving only the vanadium result in DUP 06 as having a result qualified for field duplicate results issues. Otherwise, the field duplicate results in the pairs of field duplicate samples demonstrated acceptable sampling representativeness and precision, with results generally less than 22%RPD. The qualified sample results are presented in the summary table, Table 7.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The vanadium concentration for Sample GD015 0"-6" (JB52025-14) was listed as 141 mg/Kg on the reporting form and 4.254 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Vanadium (mg/Kg)} &= \frac{(4,254 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.60 \text{ g})(94.2/100\%)} = \frac{212,700}{1,507.2} = 141.1226 \mu\text{g/g} \\ &= 141 \text{ mg/Kg, dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 141 mg/Kg for Sample GD015 0"-6" was correctly reported. Note that the software incorporates the dilution factor into the mg/L value in the raw data quant report, hence a dilution factor of only one (DF = 1) appears in the equation above, even though the dilution factor was 5x. The dilution factor appears as "Corr. Factor: 5.000" on the quant report. This was the highest vanadium concentration of the samples in this SDG, a value above the SRS of 31 mg/Kg.

Reporting Limits

The case narrative did identify that there were many samples that were diluted. There were actually 13 samples that underwent a dilution, five samples were diluted by a factor of five (5x), four were diluted by a factor of ten (10x), two that were diluted by a factor of four (4x), and two that were diluted by a factor of two (2x).

The affected samples with the adjusted reporting limits above the respective SRS values are presented below in Table 6. While the reporting limits for antimony, chromium, nickel, thallium and vanadium became elevated upon dilution, only those antimony and thallium reporting limits tabulated below were observed to fall above the respective SRS values. Even though there were four samples diluted by a factor of 10x, and five by a factor of 5x, only these five samples experienced raised reporting limits above the SRS values, partly because the total solids contents were low, three being approximately 70% or less.

Table 6. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit	Dilution Factor	Adjusted Result (mg/Kg)	Remediation Standard
GD013 7-7.5	JB52025-9	Antimony	< 1.3	10	< 13	6
GD013 7-7.5	JB52025-9	Thallium	< 0.63	10	< 6.3	3

GD015 0"-6"	JB52025-14	Antimony	< 0.66	10	< 6.6	6
GD015 0"-6"	JB52025-14	Thallium	< 0.33	10	< 3.3	3
GD015 7.5-8	JB52025-16	Thallium	< 0.56	10	< 5.6	3
GD012 7.5-8	JB52025-30	Antimony	< 1.42	5	< 7.1	6
GD012 7.5-8	JB52025-30	Thallium	< 0.7	5	< 3.5	3
GD012 8.5-9	JB52025-31	Antimony	< 1.4	10	< 14	6
GD012 8.5-9	JB52025-31	Thallium	< 0.69	10	< 6.9	3
Units – mg/Kg						
< - The analyte was analyzed for, but was not detected above the stated reporting limit.						

Although some samples were diluted up to a dilution factor of 10, only the reporting levels of these five samples exceeded the respective SRS values for antimony and thallium, as presented above in Table 6, due partly to the magnitude of the dilution factor and partly due to the low percent solids found in a sample which effected a raising of the reporting limit above the two SRS values. The reporting limits of (non-detect) analytes in other samples, irrespective of the applied dilution, were all below the respective SRS values in the remaining soil samples of SDG JB52025. These elevated reporting limits did not compromise the evaluation of the sample results, because each of these affected samples exhibited at least one concentration of an analyte above the respective SRS, except JB52025-31, thereby diminishing the effect or influence of the raised reporting limits observed in Table 6.

Summary of Metals Analysis

The soil sample analytical results for the samples of SDG JB52025 were found to be compliant with the analytical methods for the analysis of metals in the fifty-one soil samples using SW-846 Method 6010C.

The QC criteria were met for the metals target analyte analyses, except for the following issues. Antimony experienced low MS and MSD recoveries in the three QC batches associated with 28 samples: JB52025-1, JB52025-3 through -7, JB52025-9 through -12, JB52025-14 through -19, and JB52025-21 through -24, JB52035-5A, JB52025-26A, and JB52025-27 through -32 (inclusive). The chromium spike recoveries were below QC limits in the MSD sample associated with 5 samples, JB52025-28 through -32 (inclusive), as presented below in Table 7. These recoveries for antimony and chromium in the associated samples indicate possible matrix interference and/or possible sample non-homogeneity. The antimony and chromium results in these samples are qualified as estimated values (flagged "NJ-") in the associated soil samples due to a potential low bias in the ability to recover these analytes in the given sample matrices. The chromium, nickel and vanadium in the samples listed in Table 7 are qualified as estimated values and flagged with "EJ" due to a potential variability in the reported results due to the presence of interference in the sample matrix.

Field duplicate sample results subject to qualification and flagged with "J" included only the nickel result in DUP 06. The vanadium result in GD012 0"-6" and the chromium results in GD012 0"-6" and DUP 06 were not additionally flagged with "J", because the results are already qualified as estimated values and are flagged with "EJ" in these samples due to the potential variability in the analytical precision or sample non-homogeneity.

Table 7. Summary Qualified Sample Metals Results in SDG JB52025

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
DUP 06	JB52025-1	Antimony	< 0.76	NJ-
DUP 06	JB52025-1	Chromium	7.8	EJ
DUP 06	JB52025-1	Nickel	27.4	EJ

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
DUP 06	JB52025-1	Vanadium	37.4	J
GD014 6-6.5	JB52025-3	Antimony	< 0.90	NJ-
GD014 6-6.5	JB52025-3	Chromium	87.0	EJ
GD014 6-6.5	JB52025-3	Nickel	7.5	EJ
GD014 7-7.5	JB52025-4	Antimony	1.1	NJ-
GD014 7-7.5	JB52025-4	Chromium	25.7	EJ
GD014 7-7.5	JB52025-4	Nickel	23.1	EJ
GD014 8-8.5	JB52025-5	Antimony	1.2	NJ-
GD014 8-8.5	JB52025-5	Chromium	15.1	EJ
GD014 8-8.5	JB52025-5	Nickel	46.6	EJ
GD014 9-9.5	JB52025-6	Antimony	< 1.2	NJ-

GD012 9.5-10	JB52025-32	Vanadium	30.3	EJ

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.
high.

NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

NJ+ – The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased.

J – The reported result is an estimated value.

* – Duplicate analysis not within control limits; indeterminate bias direction.

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one for the field blank analysis.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ Quantitation checks | √ Data qualifiers |
| √ Data package completeness | |

Hexavalent chromium was detected in 16 of the 28 soil samples analyzed in SDG JB52025. Hexavalent chromium was detected in seven of the samples with concentrations greater than the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries. The RPD value for the duplicate analysis in QC Batch GP75897 was outside QC limits, but was considered acceptable due to low duplicate and sample concentration (differed by less than twice the reporting limit).

Calibrations

The initial calibrations demonstrated acceptable correlation coefficients with values exceeding 0.9998 for the soil sample analyses and 0.9997 for the aqueous sample (field blank) analysis, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 92.1% to 97.5% for the two QC batches associated with the 28 soil samples, and 97.7% to 98.3% for the aqueous sample analysis, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L), or the field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 8. No hexavalent chromium results required qualification based on the results of the MS recoveries.

Table 8. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP75896	JB52025-1	Cr ⁺⁶ , soluble	82.6 %	----	----
GP75896	JB52025-1	Cr ⁺⁶ , insoluble	91.6 %	----	----
GP75897	JB52025-28	Cr ⁺⁶ , soluble	78.9 %	----	----
GP75897	JB52025-28	Cr ⁺⁶ , insoluble	90.6 %	---	----
GN94417	JB52011-3	Cr ⁺⁶ , soluble	87.06 %		

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium

Duplicate Sample Analysis

The duplicate analysis result for QC sample JB52025-28 was 105.5%RPD. However, this was attributable to the fact that the "raw value" sample results were both below the reporting limit of < 0.43 mg/Kg. Thus, the results actually meet the QC limit of differing by less than twice the reporting limit (< 2 × CRQL) for low-level (< 5 × reporting limit) concentrations. The remaining duplicate analyses met QC requirements with values less than 3.7 %RPD, including Cr+6, redox potential and pH analyses. Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 86.5% to 94.9% for the soil analyses and 100% for the aqueous sample analysis, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No serial dilution analysis was performed in either of the two QC batches for the soil sample analysis. This is not a required analysis of the method.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

The non-detect hexavalent chromium results for the two pairs of field duplicate samples in Table 9 for SDG JB52025 were almost identical and, thus, demonstrate excellent sampling representativeness and precision.

Table 9. Comparison of Field Duplicate Soil Sample Results – SDG JB52025

Analyte	GD012 0"-6" (mg/Kg)	DUP 06 (mg/Kg)	% RPD	DV Flag
Hex. chromium	< 0.43	< 0.41	< 2 × CRQL	-
Analyte	GD014 9-9.5 (mg/Kg)	DUP 07 (mg/Kg)	% RPD	DV Flag
Hex. chromium	< 0.55	< 0.51	< 2 × CRQL	-
< – The analyte was not detected at the stated reporting limit. CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit. < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.				

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$Cr^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

- Where:
- A = conc. from calibration curve (mg/L)
 - B = Final digested volume (L)
 - C = Wet wt of sample (Kg)
 - D = % Solids/100
 - E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample GD012 7.5-8 (JB520265-30) was listed as 524 mg/Kg on the reporting form and 0.2716 mg/L for a 25-fold dilution on the quantitation report in the raw data. A calculation check provides the following result:

$$Cr^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$Cr^{+6} \text{ (mg/Kg)} = \frac{0.2716 \text{ mg/L} \times 0.1 \text{ L} \times 25}{0.00242 \text{ Kg} \times 53.5/100} = \frac{0.6790}{0.0012947} = 524.4446 \text{ mg/Kg}$$

$$Cr^{+6} \text{ (mg/Kg)} = 524 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 524 mg/Kg for Sample GD012 7.5-8 was correctly reported. This was the highest detected Cr⁺⁶

concentration detected among the 28 soil samples of this SDG, JB52025, a value clearly above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

All of the 28 soil samples fell below the Eh-pH phase diagram line. These results suggest that all of the samples experience conditions of a “reducing” soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. However, there were seven of the detected Cr+6 concentrations which were above the SRS of 20 mg/Kg, the highest being 524 mg/Kg in GD012 7.5-8 (JB52025-30). The other results included a high of 93.6, one 37.7 mg/Kg result, while the others were less than 28 mg/Kg. All of these results were associated with samples with soil conditions representative of a “reducing” environment.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were within QC limits, as were all other QC results associated with the hexavalent chromium analysis, including the duplicate sample analysis, no Cr⁺⁶ results were qualified following the DV review.

SDG JB52025R

One soil sample (JB52025-19R) was re-analyzed for SPLP leachate analysis of nickel in Sample 107_I044 11.5-12. Note that the laboratory still presented the client ID as 107_I044 11.2-12 in the data package.

All QC results were within control limits, except for the 12.4%D serial dilution result for nickel. Thus, the nickel result in Sample JB52025-19R is subject to qualification as an estimated value to be flagged with “EJ” (Table 10). The nickel result in the initial soil sample analysis was 2710 E mg/Kg, because the concentration had exceeded the calibration range of the instrument.

Table 10. Qualified SPLP Leachate Results

Sample ID	Lab ID	Analyte	Result (mg/L)	DV Qualifier
107_I044 11.5-12	JB52025-19R	Nickel	0.040	EJ
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.				

SDG JB52025T

One soil sample (JB52025-19T) was re-analyzed for the five target metals in Sample 107_I044 11.5-12. Note that the laboratory again presented the client ID as 107_I044 11.2-12 in the data package.

The QC results were within control limits, except for the 39.8% and 39.1% MS/MSD recoveries for antimony, and the 36.2 %RPD duplicate analysis result for vanadium. Thus, the antimony result in Sample JB52025-19T is subject to qualification as an estimated value to be flagged with “NJ-” due

to potential low bias in the ability to recover antimony if the sample matrix, and the vanadium result qualified as an estimated value flagged with "EJ" for possible variability in the analytical precision potentially due to variability in analytical precision or sample non-homogeneity. The qualified results are presented in Table 11.

Table 11 Qualified Results for Re-analysis of Sample JB52025-19T

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
107_I044 11.5-12	JB52025-19T	Antimony	< 7.3	NJ-
107_I044 11.5-12	JB52025-19T	Vanadium	28.1	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction;
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
<	The compound was analyzed, but was not detected at the stated reporting limit.
J	The reported result is an estimated value.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits;
*J	Duplicate analysis not within control limits; estimated value with an indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference; indeterminate bias direction.

(5x) JB52025-19, 22, 24, 29, 30. JB52025-30 (25x)

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

Antimony in JB52025- 9, 14, 30, 31 and -19T

Thallium in JB52025- 9, 14, 16, 30, 31 and 19T.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Thirteen nickel: JB52025-5, 9, 11, 14, 15, 16, 18, 19, 23, 24, 27, 30, 32.

One Antimony: JB52025-16

One Thallium: JB52025-19

Seven Cr⁺⁶: JB52025-15, 16, 21, 22, 23, 30, 31.

Three Vanadium: JB52025-9, 14, 30.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to report discussions of case narrative regarding QC limit exceedances.

No analytical problems regarding procedures was noted.

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, 5 and 8 for details.

Qualified sample results are presented in Tables 7, 10, and 11 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB52135
Sample Date: November 5, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: February 14, 2014

This data validation (DV) report presents the data review and result qualifications for thirty-two (32) soil samples collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 5, 2013 for sample delivery group (SDG) JB52135. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB52135 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 32 collected soil samples.

Following the detailed DV review, the following sample results were qualified:

- Antimony (*NJ-) in Samples JB52135-1 through -11 (inclusive);
- Antimony (NJ-) in Samples JB52135-12 through -32 (inclusive);
- Chromium (EJ) in Samples JB52135-12 through -31 (inclusive);
- Chromium (ENJ-) in Sample JB52135-32;
- Nickel (NJ-) in Samples JB52135-1 through -11 (inclusive);
- Nickel (*ENJ-) in Samples JB52135-12 through -31 (inclusive);
- Nickel (ENJ+) in Sample JB52135-32;
- Vanadium (*J) in Samples JB52135-1 through -11 (inclusive);
- Vanadium (ENJ-) in Samples JB52135-12 through -32 (inclusive);
- Hexavalent chromium (*J) in Samples JB52135-1 through -13 (inclusive);
- Hexavalent chromium (NJ-) in Samples JB52135-14 through -32 (inclusive).

No other sample results in SDG JB53125 required qualification. Details are provided in the tables and text below. The individual sample results that were qualified following the DV review are identified in Tables 7 and 11 of this DV report.

The reported concentrations were below the respective site remediation standard (SRS) limits, except for eleven nickel results, two vanadium and one hexavalent chromium (Cr^{+6}) result. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The thirty-two (32) soil samples collected November 5, 2013, were received the same day at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 3.4°C. The samples destined for metals analysis were received at the Accutest Laboratories Southeast, Inc. in Orlando, Florida November 7, 2013 preserved and in good condition with sampling cooler temperatures of 3.8°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary – SDG JB52135

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories SE in Orlando Florida.
 Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB52135, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) "*National Functional Guidelines for Inorganic Data Review*", OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|----------------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Samples | Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. The sample results exhibited concentrations below the respective site remediation standard (SRS) levels for metals in the 32 soil samples of this SDG, except for eleven nickel results and two vanadium results.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were identified as being outside QC limits in each of the three QC batches of this SDG, as were the nickel matrix spike recoveries. The MS/MSD recovery for chromium and the MSD for vanadium were also outside control limits in QC Batch MP26349, but the spike amounts were low relative to the sample amounts. The MS/MSD recoveries were outside QC limits in QC Batch MP26350, while the MS/MSD recoveries for antimony, chromium, nickel and vanadium were outside QC limits in MP26356. Duplicate analysis results were outside control limits for antimony and vanadium in MP26349, while the duplicate analysis nickel results were outside control limits in MP26350. The case narrative also identified the serial dilution result being outside QC limits in QC Batches MP26350 and MP26356 for antimony, chromium, nickel and vanadium and stated that the percent difference was acceptable due to low initial sample concentration (< 50 times IDL). However, closer inspection of the data during the DV review revealed that this statement only applied to antimony, while the other three analytes had concentrations greater than 50 times the IDL. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids. The QC results for the hexavalent chromium analyses are presented in the hexavalent chromium text. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

The QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the internal standard area counts identified below.

The exceptions included the internal standard area counts for IS#2 which is associated with chromium and vanadium in analytical runs MA11209 and MA11211 and IS#1 which is associated with antimony in sample JB52135-30 of MA11209. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Consequently, each of the four affected samples exhibited area counts of under 130%, thereby meeting the calibration requirements, as the IS area counts are considered acceptable. Thus, the samples did not warrant reanalysis and the results for the associated chromium, vanadium, and antimony are considered acceptable for these four samples. Therefore, no soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks or the continuing calibration blanks, except thallium, at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB52135. Although thallium was detected above the reporting limit in several CCBs, no results were subject to qualification for associated QC blank contamination, because the affected samples were reanalyzed and thallium was subsequently not detected in any of the soil samples of this SDG.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were outside QC limits of 75 - 125% for QC samples in the three identified QC batches associated with the soil samples which are summarized in Table 2 below. The nickel MS recovery in QC Batch MP26349 was below QC limits, while the MS/MSD recoveries were low in MP26350. The MS recovery for nickel in MP26356 was above QC limits, as presented below in Table 2. The vanadium spike recoveries were below QC limits in the MSD sample in MP256350, while the vanadium and chromium recoveries were below QC limits in the MS/MSD samples of MP26356. The nickel MS recovery in QC Batch MP26356 was above QC limits, as presented below in Table 2. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity.

Following the DV review, the sample results associated with low MS and/or MSD recoveries were subject to qualification and were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential low bias in the ability to recovery these affected analytes in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The detected nickel result associated with QC Batch MP26356 was qualified as an estimated value and flagged with "NJ+" due to a potential positive (high) bias. Although the chromium MS/MSD recoveries in MP26349 and MP26350, as well as the vanadium recoveries in MP26349 were outside QC limits, the associated sample results were not subject to qualification because the ability to recover the spike may have been masked by the large initial sample concentrations which were more than four times the spike value (USEPA, 2010). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26349 Ω	JB52135-1	Antimony	67.5 %	13.7 %	NJ-	Low

MP26356 #	FA9883-1	Chromium	20.7 %	-5.6 %	NJ-	Low
MP26356 #	FA9883-1	Nickel	208.7 %	77.5 %	NJ+	High
MP26356 #	FA9883-1	Vanadium	10.5 %	-13.9 %	NJ-	Low

QC Limits are 75-125%;

NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.

NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.

*** – Sample concentration > 4 × spike amount; samples not subject to qualification.

MS – Matrix spike

MSD – Matrix spike duplicate.

Ω – The samples associated with QC Batch MP26349 consist of JB52135-1 through -11 (inclusive);

† – The samples associated with QC Batch MP26350 consist of JB52135-12 through -31 (inclusive);

– The samples associated with QC Batch MP26356 consist of JB52135-32.

The antimony results in all of these affected samples are flagged with “NJ-” due to a potential low bias, as were the nickel results in samples JB52135-1 through -31 (inclusive), while the nickel result in JB52135-32 was flagged with “NJ+” as it may exhibit a potential positive bias in the this identified sample. The chromium result in JB52135-32 was also qualified and flagged with “NJ-” as presented below in summary table, Table 7 together with the results qualified for the duplicate and serial dilution analyses results. The vanadium results in Samples JB52135-12 through -32 are flagged with “NJ-” due to a potential low bias.

A possible explanation for the low spike recoveries of antimony may be due to problems with the procedure, as it has been noted in the literature that the use of Methods EPA 3020 and 3050 may be inappropriate for the effective analysis of some metals, including antimony and chromium (Smith, 1999).

Duplicate analysis (QC Limit ≤ 35 %RPD)

The case narrative stated that the RPD of the duplicate analysis for antimony and vanadium were outside QC limits in QC Batch MP26349 due to possible sample non-homogeneity. The case narrative also stated that the RPD of the duplicate analysis for antimony, chromium and nickel were outside QC limits in QC Batch MP26350 due to possible sample non-homogeneity. However, inspection of the data revealed that the RPD values for antimony and chromium were below the 35%RPD QC limit for technical data quality assessment in DV guidelines (USEPA, 2010), such that only the nickel results associated with this QC batch are subject to qualification for analytical precision issues. The duplicate result for antimony in MP26356 was 200%RPD, but this was acceptable because of the low sample concentrations (the difference was less than 2 × CRQL). All remaining %RPD values were below the QC limit of 35%RPD, with values ranging 0 to 32.3%RPD for soil samples and, thus, no other results required qualification.

Thus, the antimony and vanadium results associated with QC Batch MP26349 and the nickel results associated with QC Batch MP26350 are qualified as estimated values and are to be flagged with “*J” due to the potential variability in the analytical precision, though without exhibiting any clear bias direction. When the “*J” qualifiers are combined with the qualifiers associated with the low antimony MS/MSD recoveries in the QC sample of this batch, the antimony results appear with “*NJ-” in the summary table, Table 7, while the nickel results are flagged with “*ENJ-”.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
MP26349 Ω	JB52135-1	Antimony	124.3 %RPD	*J
MP26349 Ω	JB52135-1	Vanadium	38.6 %RPD	*J
MP26350 †	JB52135-12	Nickel	135.2 %D	*J
QC Limit is 35%RPD; * – Duplicate analysis not within control limits; indeterminate bias direction. J – The reported result is an estimated value. Ω – The samples associated with QC Batch MP26349 consist of JB52135-1 through -11 (inclusive); † – The samples associated with QC Batch MP26350 consist of JB52135-12 through -31 (inclusive).				

Aside from the antimony and vanadium results in QC Batch MP26349, and nickel in MP26350, the remaining duplicate analyses demonstrated acceptable analytical precision.

Three pairs of spiked duplicate samples were analyzed in SDG JB52135 and %RPD results reported. Three of the %RPD values were greater than 35%RPD. However, upon closer inspection of the data, it was observed that the differences were likely attributable due to the difference in spike values in the spike duplicates, rather than differences attributable to issues with analytical precision. Consequently, it was judged appropriate to not qualify the associated sample results because the differences between the spiked sample concentrations were proportional to the differences in the spike amounts.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 93.9% - 102.0% for the soil sample metals analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative stated that the RPDs for antimony, chromium, nickel, and vanadium were outside QC limits in QC Batch MP26350 and QC Batch MP26356, but that the percent difference (%D) values were acceptable due to the low initial sample concentrations (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010). However, upon closer inspection, it was observed that this statement for each batch actually applies only to the antimony results because the initial concentrations of chromium, nickel, and vanadium in the QC samples were, in fact, above the 50 × IDL criterion. The %D values for chromium, nickel and vanadium in both batches exceeded the QC limit of 10%D and are, therefore, subject to qualification. These results are summarized below in Table 4.

Table 4. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26350 †	JB52135-12	Chromium	75.8 %D	EJ
MP26350 †	JB52135-12	Nickel	75.4 %D	EJ
MP26350 †	JB52135-12	Vanadium	75.8 %D	EJ
MP26356 #	FA9883-1	Chromium	19.2 %D	EJ
MP26356 #	FA9883-1	Nickel	15.4 %D	EJ
MP26356 #	FA9883-1	Vanadium	17.9 %D	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
† – The samples associated with QC Batch MP26350 consist of JB52135-12 through -31 (inclusive);
– The samples associated with QC Batch MP26356 consist of JB52135-32.

Consequently, the chromium, nickel, and vanadium results in the associated samples of these two QC batches were qualified as estimated values and flagged with “EJ”, as presented in the summary table, Table 7 below. Because the MS and/or MSD recoveries for nickel and vanadium in MP26350 were below QC limits, and the duplicate analysis for nickel was outside QC limits, the nickel and vanadium results associated with this QC batch are actually flagged with “*ENJ-” and “ENJ-”, respectively, while the chromium, nickel, and vanadium results in Sample JB52135-32 are flagged with “ENJ-”, “ENJ+”, and “ENJ-” in combining the various qualifications in order to avoid redundancy, as presented in Table 7.

The results qualified for serial dilution results are qualified as estimated values due to potential variability likely affected by the presence of some type of matrix interference, but without any determinate bias direction.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

Seven sets of field duplicate samples were collected as part of SDG JB52135. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2012), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of the seven pairs of field duplicate samples are presented in Table 5, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples were very similar in five of the seven pairs of samples analyzed and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 38 %RPD or differed by less than two times the reporting limit value (< 2 × CRQL) for all analyte pairs, except for the chromium results for the field duplicates from DD007 2-2.5 and DD007 6-6.5, and the nickel results from DD006 8-8.5 and DD007 6-6.5. Soil sample non-homogeneity may have contributed to the observed disparities.

Table 5. Comparison of Field Duplicate Soil Sample Results – SDG JB52135

Antimony	< 3.6 NJ-	< 4.3 NJ-	< 2 × CRQL	-
Chromium	13.9 EJ	33.1 EJ	81.7 %	(J)
Nickel	12.2 *ENJ-	24.6 *ENJ-	67.4 %	(J)
Thallium	< 1.8	< 2.1	< 2 × CRQL	-
Vanadium	18.0 ENJ-	22.8 ENJ-	23.5 %	-
Analyte	DD008 2-2.5 (mg/Kg)	DUP 15 (mg/Kg)	% RPD	DV Flag
Antimony	< 1.9 NJ-	< 2.2 NJ-	< 2 × CRQL	-
Chromium	22.1 EJ	32.3 EJ	37.5 %	-
Nickel	35.6 *ENJ-	28.4 *ENJ-	22.5 %	-
Thallium	< 0.96	< 1.1	< 2 × CRQL	-
Vanadium	18.7 ENJ-	23.1 ENJ-	21.0 %	-

< – The analyte was not detected at the stated reporting limit;
J – The reported result is an estimated value;
NJ+ – The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high;
NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low;
* – The duplicate analysis result is outside QC limits;
*J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction;
EJ – The reported value is estimated because of the presence of interference.
(J) – Sample result is subject to DV qualification, but not additionally flagged with “J” to avoid redundancy;
CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;
< 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

Consequently, due to the disparity in the respective detected chromium and nickel results for the field duplicate samples from DD006 8-8.5, DD007 2-2.5, and DD007 6-6.5, these results are subject to qualification and are to be flagged with “J”, as indicated in Table 5 above. However, the chromium results from the field duplicates of DD007 2-2.5 and DD007 6-6.5 are already qualified and flagged with “EJ” and the nickel results from DD006 8-8.5 and DD007 6-6.5 are already qualified and flagged with either “*ENJ-” or “NJ-”. Consequently, these affected sample results were not further flagged with an additional “J” in an effort to avoid redundancy in the applied qualifiers. Otherwise, the field duplicate results in six of these seven pairs of field duplicate samples demonstrated very good sampling representativeness and precision, with results generally less than 25%RPD.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The vanadium concentration for Sample DD007 4-4.5 (JB52135-24) was listed as 115 mg/Kg on the reporting form and 2.261 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Vanadium (mg/Kg)} = \frac{(2.261 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.09 \text{ g})(90.3/100\%)} = \frac{113,050}{95.022} = 114.7658 \mu\text{g/g}$$

= 115 mg/Kg, dry weight

After rounding to three significant figures, this verifies that the vanadium concentration of 115 mg/Kg for Sample DD007 4-4.5 was correctly reported. This was the highest vanadium concentration of the samples in this SDG, a value above the SRS of 78 mg/Kg.

Reporting Limits

The case narrative did identify that there were many samples that were diluted. There were actually 11 samples that were diluted by a factor of two (2×), nine by a factor of four (4×), one by a factor of five (5×), with one sample diluted by a factor of ten (10×) for reporting the antimony, chromium, thallium and vanadium results (JB52135-1).

The affected samples with the adjusted reporting limits above the respective SRS values are presented below in Table 6. While the reporting limits for antimony, chromium, nickel, thallium and vanadium became elevated upon dilution, only those antimony and thallium reporting limits tabulated below were observed to fall above the respective SRS values.

Table 6. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit	Dilution Factor	Adjusted Result (mg/Kg)	Remediation Standard
ED014 9.5-10	JB52135-1	Thallium	< 0.54	10	< 5.4	3
DUP 10	JB52135-7	Antimony	< 1.44	5	< 7.2	6
DUP 10	JB52135-7	Thallium	< 0.72	5	< 3.6	3
DD007 4-4.5	JB52135-24	Thallium	< 2.0	2	< 4.0	3

Units – mg/Kg
< - The analyte was analyzed for, but was not detected above the stated reporting limit.

For samples of this SDG, the thallium reporting limit generally is approximately 0.5 mg/Kg for an undiluted sample. However, in Sample JB52135-24, the analyst compensated for the observed presence of some interference in the raw data and raised the reporting limit higher as a conservative measure, as explained by the laboratory representative.

Although some samples were diluted up to a dilution factor of 10, only the reporting levels of these three samples exceeded the respective SRS values for antimony and thallium, as presented above

in Table 6, some due to the low percent solids found in the sample which effected a raising of the reporting limit above the two SRS values, such as that observed for Sample JB52135-7. Other sample reporting limits, irrespective of the applied dilution, were all below the respective SRS values in the remaining soil samples of SDG JB52135. These elevated reporting limits did not compromise the evaluation of the sample results for JB52135-1 and JB52135-24, because the nickel and vanadium concentrations in both samples exceeded the SRS criteria of 31 mg/Kg and 78 mg/Kg, respectively, and these nickel and vanadium results are what drive the evaluation of these sample results. With possible exception of sample JB52135-7, whose antimony and thallium reporting limits did not significantly exceed the respective SRS values, the elevated reporting limits for antimony or thallium did not compromise the project evaluation procedure.

Summary

The soil sample analytical results for the samples of SDG JB52135 were found to be compliant with the analytical methods for the analysis of metals in the thirty-two soil samples using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries, differences in the duplicate sample analysis and differences in the serial dilution analysis, as summarized in Tables 2, 3, and 4. The associated sample results are qualified accordingly and listed in Table 7 below. Sample analyte results are flagged with either "NJ-", "*NJ-", "*J", "EJ", "ENJ-", or "*ENJ-".

Field duplicate sample results were subject to qualification included a few chromium and nickel results that were to be flagged with "J", as indicated above in Table 5. However, the affected chromium and nickel results were not additionally flagged with "J", because the results are already qualified as estimated values with either "EJ" for possible variability in the chromium results, and either "*ENJ-" or "NJ-" for nickel in these samples due to the potential low bias, as indicated in Table 7.

Table 7 Summary Qualified Sample Metals Results in SDG JB52135

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
ED014 9.5-10	JB52135-1	Antimony	15.7	*NJ-

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.

J – The reported result is an estimated value;

NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low;

NJ+ – The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high;

* – The duplicate analysis result is outside quality control limits.

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
E – The reported value is estimated because of the presence of interference.				

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

Hexavalent chromium was detected in 19 of 32 soil samples analyzed in SDG JB52135 with detected concentrations of 11.2 or less, except the 43.4 mg/Kg result in JB52135-1, such that only one Cr+6 result had exceeded the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that the QC requirements were met, including the holding time, method blanks, as well as the QC requirements for the pH, and redox potential analyses, except for the soluble and insoluble MS recoveries in QC Batch GP75928 for QC Sample DD008 4-4.5; and the soluble MS recovery in QC Batch GP75919 (DD006 2-2.5) which also exceeded the RPD QC limit in the duplicate analysis.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values exceeding 0.99988, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 93.8% to 96.6% for the two QC batches associated with the 32 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 8, except for the MS recoveries in QC Batch GP75928.

Table 8. Hexavalent Chromium Analysis Matrix Spike Recovery Results – SDG JB52135

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP75919 Θ	JB52135-9	Cr ⁺⁶ , soluble	74.9 %	----	----
GP75919 Θ	JB52135-9	Cr ⁺⁶ , insoluble	101.1 %	----	----
GP75919 Θ	JB52135-9	Cr ⁺⁶ , post spike	99.0 %	----	----
GP75928 §	JB52135-30	Cr ⁺⁶ , soluble	1.9 %	NJ-	Low
GP75928 §	JB52135-30	Cr ⁺⁶ , insoluble	69.0 %	NJ-	Low
GP75928 §	JB52135-30	Cr ⁺⁶ , post spike	91.6 %	----	----

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium;
Θ – The samples associated with QC Batch GP75919 consist of JB52135-1 through -13 (inclusive).
§ – The samples associated with QC Batch GP75928 consist of JB52135-14 through -32 (inclusive).

Although the soluble MS recovery in QC Batch 75919 was marginally less than 75%, the associated sample results were not qualified as estimated values because the 74.9% when rounded to two significant figures becomes 75%, a value at the lower limit of the 75-125% QC limits specified in the DV guidelines (NJDEP, 2002). For this reason, the laboratory did not reanalyze the affected sample QC batch.

Although the soluble MS recovery in QC Batch 75928 was less than 50%, the associated sample results were qualified as estimated values and flagged with “NJ-”, because the insoluble recovery was above 50%, due to a potential low bias, as discussed with Mr. Joseph Sanguiliano of the NJDEP. The post spike recovery was within QC limits further supporting the qualification of the associated Cr+6 results, rather than rejection.

Because the soluble and insoluble MS recoveries were below QC limits in QC Batch GP75928, the associated samples were to be reanalyzed. However, due to some miscommunication, the associated samples were not reanalyzed. Consequently, the samples of QC Batch GP75928 numbered JB52135-14 through -32 (inclusive) were qualified as estimated values and flagged with “NJ-”, as presented below in Table 11, due to a potential low bias in the ability to recover Cr+6 in the associated soil sample matrices.

Duplicate Sample Analysis

The duplicate sample analysis was performed on two samples where the differences among the Cr+6, pH, and redox potential were less than 26.7%RPD, except for the 61.0%RPD result in QC sample JB52135-9 in QC Batch GP75919, as depicted in Table 9.

The 61.0%RPD for Cr⁺⁶ was above laboratory QC limits (20%RPD) for the duplicate analysis of Sample JB52135-9 in QC Batch GP75919, but was also above the advisory DV QC guideline of 35%RPD for soil samples (USEPA, 2010; USEPA, 2012). Consequently, the Cr+6 results in the associated samples with laboratory sample ID numbers ranging JB52135-1 through -13 (inclusive) were qualified as estimated values and flagged with ‘*J’ due to a possible variability in the analytical precision. The ‘*’ flag is to indicate that the duplicate analysis of the QC samples were outside QC limits.

Table 9. Duplicate Sample Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
GP75919 Θ	JB52135-9	Hexavalent Chromium	61.0 %RPD	*J

QC Limit is 35%RPD;

J – The reported result is an estimated value.

* – Duplicate analysis not within control limits; indeterminate bias direction.

⊖ – The samples associated with QC Batch GP75919 consist of JB52135-1 through -13 (inclusive).

The other duplicate analyses met QC requirements with values less than 26.7 %RPD, including Cr+6, redox potential and pH analyses. The qualified results are identified in the summary table presented at the end of this DV report in Table 11.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 92.0% to 108.0%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No serial dilution analysis was performed in either of the two QC batches. This is not a required analysis of the method.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

The results for the analysis of the seven pairs of field duplicate samples are presented in Table 10, below.

Table 10. Comparison of Field Duplicate Soil Sample Results – SDG JB52135

Analyte	DD006 6-6.5 (mg/Kg)	DUP 09 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	1.9 *J	6.1 *J	> 2 × CRQL	(J)
Analyte	DD006 8-8.5 (mg/Kg)	DUP 10 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	< 0.58 *J	< 0.60 *J	< 2 × CRQL	-
Analyte	ED002 6-6.5 (mg/Kg)	DUP 11 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	1.2 NJ-	11.2 *J	> 2 × CRQL	(J)
Analyte	ED002 8-8.5 (mg/Kg)	DUP 12 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	2.9 NJ-	< 0.47 NJ-	> 2 × CRQL	(J)
Analyte	DD007 2-2.5 (mg/Kg)	DUP 13 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	0.67 NJ-	1.2 NJ-	< 2 × CRQL	-
Analyte	DD007 6-6.5 (mg/Kg)	DUP 14 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	0.64 NJ-	< 0.46 NJ-	< 2 × CRQL	-
Analyte	DD008 2-2.5 (mg/Kg)	DUP 15 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	< 0.48 NJ-	< 0.49 NJ-	< 2 × CRQL	-

QC Limit is ≤ 50 %RPD;

< – The analyte was not detected at the stated reporting limit;

J – The reported result is an estimated value;

(J) – Sample result is subject to DV qualification, but not additionally flagged with “J” to avoid redundancy;

*J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction.

NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is not within QC limits; possible low bias;

CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;
 < 2 × CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.

It is apparent that the results for the hexavalent chromium concentrations in the field duplicate samples were similar and, thus, considered representative in four of the seven pairs of soil samples, as the concentrations between field duplicate samples differed by less than two times the reporting limit value (< 2 × CRQL), except for the results > 2 × CRQL in field duplicates from DD006 6-6.5, ED002 6-6.5, and ED002 8-8.5.

As a result of the disparity in the respective hexavalent chromium results for the field duplicate samples from DD006 6-6.5, ED002 6-6.5, and ED002 8-8.5, these results are subject to qualification and are to be flagged with “J”, as indicated in Table 10 above. However, the Cr+6 results from all field duplicates are already qualified as estimated values and flagged with either “*J”, or “NJ-”. Consequently, these affected sample results were not further flagged with an additional “J” in an effort to avoid redundancy in the applied qualifiers. Acceptable sampling representativeness and precision was demonstrated in four of the seven pairs of field duplicate soil samples. Even with the observed disparity, which may be attributable to soil sample non-homogeneity or the low concentrations which may magnify the differences values, the results were all clearly below the SRS of 20 mg/Kg facilitating the use of these results in project evaluations.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

- Where:
- A = conc. from calib. curve (mg/L)
 - B = Final digested volume (L)
 - C = Wet wt of sample (Kg)
 - D = % Solids/100
 - E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample ED014 9.5-10 (JB52135-1) was listed as 43.4 mg/Kg on the reporting form and 0.8851 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.8851 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00247 \text{ Kg} \times 82.6/100} = \frac{0.08851}{0.0020402} = 43.3825 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 43.4 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 43.4 mg/Kg for Sample ED014 9.5-10 was correctly reported. This was the highest detected Cr⁺⁶ concentration among the 32 soil samples of this SDG, JB52135. Although this result was

above the SRS of 20 mg/Kg, all remaining detected Cr⁺⁶ concentration results were 11.2 mg/Kg or less.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams, except for the Eh result for Sample JB52135-29. No other disparities relative to the reported values and characteristics were observed. All results met the QC limits, such that no pH or redox potential (ORP) results are subject to qualification.

The redox potential result for Sample JB52135-29 was incorrectly recorded as 2661 mV, which is off scale for the Eh-pH phase diagram. Closer review of the data revealed that 53.9 “mV vs. Ag/AgCl” electrode result was close to the 54.4 value in Sample JB52135-31, whose corresponding redox potential reading was 266.6 mV. Consequently, the result for JB52135-29 should be 266.1 mV which would then fall under the Eh-pH line, leaving only JB52135-20 (1.2 mg/Kg Cr+6) and JB52135-30 (1.3 mg/Kg) which lie above the Eh-pH line representing oxidizing conditions.

All but two of the 32 soil samples fell below the Eh-pH phase diagram line. These results suggest that almost all of the samples experience conditions of a “reducing” soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. Of these two samples experiencing oxidizing conditions, the highest detected Cr+6 concentration was 1.3 mg/Kg in JB52135-30. Only one result of the samples in this SDG (43.4 mg/Kg in JB52135-1) was detected above the SRS of 20 mg/Kg, even though the sample fell below the Eh-pH line demonstrating “reducing” conditions.

Summary for Hexavalent Chromium Analysis SDG JB52135

Since the MS recoveries in QC Batch GP75928 (JB52135-30) were below QC limits, as depicted in Table 8, the sample Cr+6 results were qualified as estimated values and flagged with “NJ-”. Consequently, the sample results associated with this QC batch are flagged with “NJ-” in Table 11, below. The samples associated with QC Batch GP75928 consist of JB52315-14 through -32 (inclusive). The samples required re-digestion and re-analysis due to the low MS recoveries, however, the samples were not reanalyzed and are left qualified as presented below.

The Cr+6 results in the samples with laboratory sample ID numbers ranging JB52135-1 through -13 (inclusive) were qualified as estimated values and flagged with ‘*J’ due to a possible variability in the analytical precision, as suggested by the 61.0%RPD duplicate analysis result in the QC sample in Batch GP75919.

Table 11. Comparison of Qualified Sample Cr⁺⁶ Results in SDG JB52135

Client ID	Laboratory Sample ID	Analyte	JB52135 Result (mg/Kg)	DV Qualifier
ED014 9.5-10	JB52135-1	Cr+6	43.4	*J

DD008 8-8.5	JB52135-32	Cr+6	< 0.52	NJ-
<p>< – The analyte was analyzed for, but not detected at the specified reporting limit. *J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction. NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is below QC limits; possible low bias.</p>				

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
<	The compound was analyzed, but was not detected at the stated reporting limit.
J	The reported result is an estimated value.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	The duplicate analysis result is outside quality control limits.
*J	The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB52135

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why. *Matrix interference.*

2x JB52135-6, 13, 14, 18, 19, 20, 23, 24, 27, 29, and 32.
 4x JB52135-5, 11, 15, 16, 21, 22, 25, 26, and 31
 5x JB52135-7

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

JB52135-1 Thallium; JB52135-24 Thallium
 JB52135-7 Antimony and Thallium

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Eleven nickel: JB52135-1, 2, 4, 5, 9, 12, 20, 23, 24, 29, 32
 Two vanadium results: JB52135-1, and -24.
 One Cr⁺⁶: JB52135-1.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative, regarding QC limit exceedances.
 No problems with analytical procedures were noted.

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Not applicable

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, 5, 8, 9 and 10 for details.

Qualified sample results are presented in tables 7 and 11 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB52302
Sample Date: November 6, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Faiza M. Botros
Janis V. Giga, Ph.D., REP5554
Report Date: February 10, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-six (26) soil samples and two (2) Field Blanks collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 6, 2013 for sample delivery group (SDG) JB52302. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB52302 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 26 collected soil samples and two Field Blanks.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB52302-1 through -22 (inclusive), and JB52302-23A, -25 and -26;
- Chromium (*EJ) in Samples JB52302-1 through -3 (inclusive);
- Chromium, nickel and vanadium (EJ) in Samples JB52302-4 through -22 (inclusive), and JB52302-24;
- Chromium and nickel (ENJ-) in Samples JB52302-25 and -26;
- Nickel (ENJ+) in Samples JB52302-1 through -3 (inclusive);
- Vanadium (*ENJ+) in Samples JB52302-1 through -3 (inclusive);
- Vanadium (NJ-) in Samples JB52302-25 and -26;
- Hexavalent Chromium (NJ-) in sample JB52302-1 through JB52302-13 (inclusive), and JB52302-27 (FB06) and JB52302-28 (FB07).

No other sample results in SDG JB52302 required qualification. Details are provided in the tables and text below. The individual sample results that were qualified following the DV review are identified in Tables 7 and 10 of this DV report.

The reported concentrations were below the respective site remediation standard (SRS) limits, except for thirteen nickel results, one antimony and one hexavalent chromium (Cr⁺⁶) result. A

data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The twenty-six (26) soil samples and two (2) Field Blanks collected on November 6, 2013, were received November 6, 2013 at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 6°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. on November 8, 2013 properly preserved and intact with sampling cooler temperatures of 3.6°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Client Sample Designation	Sample Lab ID Number	Date Collected	Matrix	Analyses
DD009 0.5-1	JB52302-1	11/06/13	Soil	Metals, Cr+6
DD009 2-2.5	JB52302-2	11/06/13	Soil	Metals, Cr+6
DD009 4-4.5	JB52302-3	11/06/13	Soil	Metals, Cr+6
ED007 0.5-1	JB52302-4	11/06/13	Soil	Metals, Cr+6
ED007 2-2.5	JB52302-5	11/06/13	Soil	Metals, Cr+6
ED007 4-4.5	JB52302-6	11/06/13	Soil	Metals, Cr+6
ED007 6-6.5	JB52302-7	11/06/13	Soil	Metals, Cr+6
ED007 8-8.5	JB52302-8	11/06/13	Soil	Metals, Cr+6
DUP 16	JB52302-9	11/06/13	Soil	Metals, Cr+6
DD011 1.5-2	JB52302-10	11/06/13	Soil	Metals, Cr+6
DD011 2.5-3	JB52302-11	11/06/13	Soil	Metals, Cr+6
DD011 3.5-4	JB52302-12	11/06/13	Soil	Metals, Cr+6
DD011 4.5-5	JB52302-13	11/06/13	Soil	Metals, Cr+6
DD011 5.5-6	JB52302-14	11/06/13	Soil	Metals, Cr+6
DD012 1.5-2	JB52302-15	11/06/13	Soil	Metals, Cr+6
DD012 2.5-3	JB52302-16	11/06/13	Soil	Metals, Cr+6
DD012 3.5-4	JB52302-17	11/06/13	Soil	Metals, Cr+6
DD012 4.5-5	JB52302-18	11/06/13	Soil	Metals, Cr+6
DD012 5.5-6	JB52302-19	11/06/13	Soil	Metals, Cr+6
DUP 17	JB52302-20	11/06/13	Soil	Metals, Cr+6
ED005 0.5-1	JB52302-21	11/06/13	Soil	Metals, Cr+6
ED005 2-2.5	JB52302-22	11/06/13	Soil	Metals, Cr+6
ED005 3.5-4	JB52302-23	11/06/13	Soil	SPLP Leachate Sb
ED005 3.5-4	JB52302-23A	11/06/13	Soil	Sb
ED005 4-4.5	JB52302-24	11/06/13	Soil	Metals, Cr+6
ED005 6-6.5	JB52302-25	11/06/13	Soil	Metals, Cr+6
ED005 8-8.5	JB52302-26	11/06/13	Soil	Metals, Cr+6
FB06	JB52302-27	11/06/13	Aqueous	Metals, Cr+6
FB07	JB52302-28	11/06/13	Aqueous	Metals, Cr+6

Metals – Antimony (Sb), chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast, Inc. in Orlando, FL;
 SPLP Leachate analyzed only for antimony (Sb);
 Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB52302, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgment, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. There were some sample results of the 26 soil samples that exhibited concentrations above the respective site remediation standard (SRS) levels. These included 13 nickel results and one antimony result.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony and vanadium, and nickel in the MS analysis were identified as being outside QC limits in QC Batch MP26360, while the chromium MS/MSD recoveries were also outside QC limits, but the spike amount was low relative to the sample concentration. The case narrative also identified the RPD results for antimony, chromium and vanadium as being outside QC limits in the duplicate analysis of MP26360. The case narrative also identified the MS/MSD recoveries for antimony and the MS recovery for nickel as being outside QC limits in QC Batch MP26361, while the MS/MSD recoveries for antimony, chromium, nickel and vanadium were outside QC limit in QC Batch MP26362.

The case narrative identified the serial dilution results being outside QC limits in QC batches MP26360 and MP26361 for antimony, chromium, nickel and vanadium and stated that the percent difference was acceptable due to low initial sample concentration (< 50 times IDL). This statement conflicted with other statements stating that the serial dilution results for chromium, nickel, and vanadium indicate possible matrix interference. Apparently this statement should only be applied for antimony. Similar conflicting statements were made regarding the serial dilution results for QC Batch MP26362 for antimony, chromium and nickel, but only chromium and nickel had comments about matrix interference. Elevated reporting limits were listed in the case narrative for most analytes in many samples. Various other comments in the extensive case narrative were presented, however, not all were relevant to qualification in the DV review.

All other QC requirements were met, including analyses for pH, oxidation reduction potential, total solids, and the leachate analysis. Details are discussed in the sections below

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

Almost all QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There were, however, a few exceptions.

One of the exceptions consisted of a low (40%) recovery for antimony below the 70-130% QC limits in the closing CRIA2 standard of analytical sequence MA11213 which followed the analysis of eleven undiluted samples of SDG JB52302. Following a detailed review of reporting limits for the affected samples, it was observed that the detected concentrations and reporting limits for the non-detect results were all above the "affected range" (true spike \pm CRQL) for each of the associated samples and, thus, no sample antimony results are subject to qualification (USEPA, 2010).

Additionally, there were two samples whose internal standard (IS#1 and IS#2) area counts were above the identified QC limits in analytical sequence MA11213. Internal standard IS#2 is associated with chromium and vanadium, while IS#1 is associated with antimony. In the analytical sequence MA11213, the area counts for IS#1 and IS #2 in JB52302-15 and JB52302-18 were identified as being outside QC limits on the QC summary report, exceeding the listed QC range of 60-125%. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Review of the data revealed that the area counts for IS#1 and IS#2 (ranging 125%-128%) in these two samples were actually within the updated QC limits of 70-130%. Thus, these samples did not warrant reanalysis and the results for chromium, vanadium, and antimony are considered acceptable. Consequently, the affected samples in MA11213 were not reanalyzed, as the IS area counts are considered acceptable by the laboratory. Consequently, no soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or field blanks at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB52302.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike recoveries are summarized in Table 2 for the analytes and QC samples that recovered outside QC limits. The sample ID numbers that are associated with these affected QC batches are also listed at the bottom of the table.

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were outside QC limits of 75 - 125% for QC samples in three of the four identified QC batches which are summarized in Table 2 below, the fourth being associated with the leachate analysis where the recoveries were acceptable. These excursive recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Additionally, the chromium, nickel and vanadium recoveries were below QC limits in MP26362, while the nickel and vanadium recoveries associated with the first three samples exhibited elevated spike recoveries. Following the DV review, the sample results subject to qualification for spike recoveries outside QC limits were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential or low bias in the ability to recover the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). Those nickel and vanadium results associated with high spike recoveries are flagged with "NJ+" for the potential positive bias. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26360 Ω	JB52302-1	Antimony	18.2 %	18.6 %	NJ-	Low
MP26360 Ω	JB52302-1	Nickel	129.5 %	82.3 %	NJ+	High
MP26360 Ω	JB52302-1	Vanadium	139.2 %	124.6 %	NJ+	High
MP26361 †	JB52302-4	Antimony	19.3 %	21.0 %	NJ-	Low

MP26362 ¥	JB52302-25	Antimony	32.4 %	33.6 %	NJ-	Low
MP26362 ¥	JB52302-25	Chromium	19.8 %	45.9 %	NJ-	Low
MP26362 ¥	JB52302-25	Nickel	68.8 %	67.0 %	NJ-	Low
MP26362 ¥	JB52302-25	Vanadium	69.2 %	75.5 %	NJ-	Low

QC Limits are 75-125%;

NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.

NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.

MS – Matrix spike

MSD – Matrix spike duplicate.

Ω – The samples associated with QC Batch MP26360 consist of JB52302-1 through -3 (inclusive);

† – The samples associated with QC Batch MP26361 consist of JB52302-4 through -22 (inclusive), and JB52302-24.

¥ – The samples associated with QC Batch MP26362 consist of JB52302-23A, JB52302-25 and -26.

The antimony results in all of these affected samples are flagged with “NJ-” due to a potential low bias. The detected nickel and vanadium results in samples JB52302-1, -2, and -3 are flagged with “ENJ+” and “*ENJ+”, respectively, because the samples were associated with serial dilution results outside QC limits, while the duplicate result for vanadium in the QC sample was above QC limits in the QC sample associated with the three samples, as was the chromium duplicate result (“*EJ”). These qualified results are presented below in summary table, Table 7, together with the results qualified for the duplicate and serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The case narrative identified the RPD values in the duplicate analysis as being above the QC limit for chromium, nickel, and antimony in QC Batch MP26360 due to possible sample non-homogeneity. However, the difference between the antimony concentrations in Sample JB52302-1 was less than two times the reporting limit (< 2 × CRQL) QC limit for technical data quality assessment in DV guidelines (USEPA, 2010), such that only the chromium and vanadium results associated with this QC batch are subject to qualification for analytical precision issues, as summarized in Table 3. All remaining %RPD values were below the QC limits of either 35%RPD or < 2 × CRQL for soil samples and, thus, no other results required qualification.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Duplicate Difference	DV Qualifier
MP26360 Ω	JB52302-1	Chromium	54.3 %RPD	*J
MP26360 Ω	JB52302-1	Vanadium	38.7 %RPD	*J

QC Limit is 35%RPD;

*J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction.

Ω – The samples associated with QC Batch MP26360 consist of JB52302-1 through -3 (inclusive).

Thus, following the DV review, the chromium and vanadium results associated with QC Batch MP26360 are qualified as estimated values and are to be flagged with “*J” due to the potential variability in the analytical precision as indicated in Table 3, due possibly to sample non-

homogeneity, though without exhibiting any clear bias direction. When the “*J” qualifiers are combined with the qualifiers associated with the elevated vanadium MS recovery and elevated serial dilution results for chromium and vanadium in the QC sample of this batch, the chromium results appear with “*EJ” and vanadium results appear with “*ENJ+” in the summary table, Table 7. Aside from the chromium and vanadium results in QC Batch MP26360, the remaining duplicate analyses demonstrated acceptable analytical precision.

The duplicate analysis was also performed on three pairs of spiked duplicate samples. All %RPD values were below the QC limit of 35%RPD, with values ranging 0.9-30.3%RPD for soil samples and no results required qualification. The spiked duplicate analyses demonstrated very good analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 91.5% - 108.0% for the soil sample metals analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative stated that the RPDs for antimony, chromium, nickel and vanadium are outside QC limits in QC batches MP26360 and MP26361, and antimony, chromium and nickel in MP26362, but that the percent difference values were acceptable due to the low initial sample concentration (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010). However, closer review of the data revealed that only the antimony concentrations in each of the QC samples was < 50 times the IDL in this batch. Consequently, the chromium, nickel and vanadium results associated with QC batches MP26360 and MP26361, and chromium and nickel results associated with MP26362 were subject to qualification, as summarized in Table 4, for exceeding the QC limit of 10%D (not RPD as stated in the case narrative). The case narrative identified the serial dilution results being outside QC limits attributable to matrix interferences. Thus, the affected chromium, nickel and vanadium results in the samples associated with elevated %D values are subject to qualification to be flagged with “EJ” following the DV review, as discussed below. These QC results are summarized in Table 4 and detailed in Table 7 below.

Table 4. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26360 Ω	JB52302-1	Chromium	16.0 %D	EJ
MP26360 Ω	JB52302-1	Nickel	13.8 %D	EJ
MP26360 Ω	JB52302-1	Vanadium	12.1 %D	EJ
MP26361 †	JB52302-4	Chromium	22.3 %D	EJ
MP26361 †	JB52302-4	Nickel	22.5 %D	EJ
MP26361 †	JB52302-4	Vanadium	21.5 %D	EJ
MP26362 ¥	JB52302-25	Chromium	11.2 %D	EJ
MP26362 ¥	JB52302-25	Nickel	13.6 %D	EJ
Note –				
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.				
Ω – The samples associated with QC Batch MP26360 consist of JB52302-1 through -3 (inclusive);				
† – The samples associated with QC Batch MP26361 consist of JB52302-4 through -22 (inclusive), and JB52302-24.				
¥ – The samples associated with QC Batch MP26362 consist of JB52302-23A,				

The associated chromium, nickel and vanadium results in samples with laboratory sample ID numbers ranging JB52302-1 through -3, inclusive, are qualified as estimated values and flagged with “*EJ”, “ENJ+” and “*ENJ+”, respectively, to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The chromium, nickel and vanadium results in samples JB52302-4 through -22, and JB52302-24 are each flagged with “EJ”, while the chromium and nickel results of JB52302-25 and -26 are flagged with “ENJ-”. The individual qualified results are presented in the summary table, Table 7, along with the results qualified for matrix spike recoveries and analytical duplicate results outside QC limits.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

Two sets of field duplicate samples were collected as part of SDG JB52302. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2012), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of the two pairs of field duplicate samples are presented in Table 5, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples were very similar in the two pairs of samples analyzed and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 44 %RPD or differed by less than two times the reporting limit value (< 2 × CRQL) for all analyte pairs, except for the nickel results for the field duplicates from DD012 5.5-6. Soil sample non-homogeneity may have contributed to the observed disparities.

Table 5. Comparison of Field Duplicate Soil Sample Results – SDG JB52302

Analyte	DD011 1.5-2 (mg/Kg)	DUP 16 (mg/Kg)	% RPD	DV Flag
Antimony	< 2.1 NJ-	< 0.96 NJ-	< 2 × CRQL	-
Chromium	41.6 EJ	37.8 EJ	9.6 %	-
Nickel	38.5 EJ	38.5 EJ	0 %	-
Thallium	< 1.0	< 0.48	< 2 × CRQL	-
Vanadium	26.5 EJ	20.8 EJ	24.1 %	-
Analyte	DD012 5.5-6 (mg/Kg)	DUP 17 (mg/Kg)	% RPD	DV Flag
Antimony	< 2.2 NJ-	< 3.5 NJ-	< 2 × CRQL	-
Chromium	19.0 EJ	29.6 EJ	43.6 %	-
Nickel	36.5 EJ	18.4 EJ	65.9 %	(J)
Thallium	< 1.1	< 1.7	< 2 × CRQL	-
Vanadium	18.9 EJ	27.5 EJ	37.1 %	-
<p>< – The analyte was not detected at the stated reporting limit; J – The reported result is an estimated value; NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low;</p>				

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
 (J) – Sample result is subject to DV qualification, but not additionally flagged with “J” to avoid redundancy;
 CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;
 < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

Consequently, due to the disparity in the nickel results for the field duplicate samples DD012 5.5-6 and DUP 17, these results are subject to qualification and are to be flagged with “J”, as indicated in Table 5 above. However, the nickel results from these two field duplicates are already qualified and flagged with “EJ”. Consequently, these affected sample results were not further flagged with an additional “J” in an effort to avoid redundancy in the applied qualifiers. Otherwise, the field duplicate results for the field duplicate samples from DD011 1.5-2 and DD012 5.5-6 demonstrated very good sampling representativeness and precision, with results generally less than 25%RPD.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported antimony results:

$$\text{Antimony (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The antimony concentration for Sample ED005 4-4.5 (JB52302-24) was listed as 67.4 mg/Kg on the reporting form and 1.425 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Antimony (mg/Kg)} &= \frac{(1.425 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.24 \text{ g})(85.2/100\%)} = \frac{71,250}{1,056.48} = 67.4409 \mu\text{g/g} \\ &= 67.4 \text{ mg/Kg, dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the antimony concentration of 67.4 mg/Kg for Sample ED005 4-4.5 was correctly reported.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 15 of the 26 soil samples that had been diluted by a factor of either two, four, or ten.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where one sample was diluted by a factor of 10x, thereby raising the reporting limit for the antimony and thallium results above the respective SRS criteria, as presented below in Table 6, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 6. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
ED007 8-8.5	JB52302-8	Antimony	< 1.2	10	< 12 NJ-	6
ED007 8-8.5	JB52302-8	Thallium	< 0.58	10	< 5.8	3

Units – mg/Kg
 < - The analyte was analyzed for, but was not detected above the stated reporting limit.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

The other analyte results associated with the non-detect soil results of antimony and thallium in JB52302-8 were all below the respective SRS values, including the non-detect (< 0.52 mg/Kg) Cr+6 result, thereby suggesting a reasonably “clean” sample.

The interpretation of the antimony (< 12 mg/Kg) and thallium result (<5.8) in JB52302-8 was not significantly compromised by the applied dilution, because review of the data indicated the reason for the raising of the reporting limit was attributable to analyst judgement in including a safety factor to compensate for the presence of some interference in the sample data, rather than the presence of the respective analyte concentrations. Since the other target analytes in the sample were considerably below their respective SRS values, it is likely that the raw amounts of antimony and thallium were similarly not elevated.

Summary

The soil sample analytical results for the samples of SDG JB52302 were found to be compliant with the analytical methods for the analysis of metals in the twenty-six soil samples and two field blanks using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries, differences in the duplicate analysis and the serial dilution analysis, as summarized in Tables 2, 3, and 4. The associated sample results are qualified accordingly and listed in Table 7 below.

Table 7. Summary Qualified Sample Metals Results in SDG JB52302

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
DD009 0.5-1	JB52302-1	Antimony	< 1.9	NJ-

Key:

- < –The analyte was analyzed for, but was not detected above the stated reporting limit.
- J – The reported result is an estimated value;
- NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low;
- NJ+ – The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high;
- * – Duplicate analysis not within control limits; indeterminate bias direction.
- EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review. The QC results associated with the SPLP leachate and field blank

analyses were all within control limits, such that the associated antimony leachate sample result and field blank results did not require qualification.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one QC batch for Field Blank samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

Hexavalent chromium was detected in 16 of 25 soil samples analyzed for Cr+6 in SDG JB52302. Concentrations of Cr+6 results had exceeded the SRS of 20 mg/Kg in only one (1) soil sample.

Case Narrative

The case narrative indicated that the QC requirements were met for issues such as holding time and method blanks. However, the soluble matrix spike recovery in QC Batch GP75946 was below the QC limits. Good insoluble MS and post spike (96.8%) recoveries were observed in this sample. In addition, the RPD value for the duplicate sample analysis was above the QC limits due to possible sample non-homogeneity. The MS recovery for a non-client aqueous sample associated with the two field blanks recovered below control limits. All other QC requirements were met for the associated samples.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values exceeding 0.9998, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 90.3% to 94.6% for the two QC batches associated with the 26 soil samples and 99.9% to 101.4% for the one associated with the field blanks, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in any of the method blanks (< 0.40 mg/Kg or 0.010 mg/L), any of the continuing calibration blanks (< 0.010 mg/L), or the two field blanks. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post-spike recoveries that were within the 85-115% QC limits, as presented below in Table 8, except for the soluble MS recovery in QC Batch GP75946. Consequently, the hexavalent chromium results of samples JB52302-1 through -13 were subject to qualification required qualification based on the results of the MS recoveries.

Table 8. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP75946 £	JB52302-1	Cr ⁺⁶ , soluble	64.3 %	NJ-	Low
GP75946 £	JB52302-1	Cr ⁺⁶ , insoluble	82.3 %	----	----
GP75946 £	JB52302-1	Cr ⁺⁶ , post-spike	96.8 %	----	----
GP75948 Ж	JB52302-25	Cr ⁺⁶ , soluble	89.6 %	----	----
GP75948 Ж	JB52302-25	Cr ⁺⁶ , insoluble	95.7 %	----	----
GP75948 Ж	JB52302-25	Cr ⁺⁶ , post-spike	99.8 %	----	----
GN94565 €	JB52291-1	Cr ⁺⁶ soluble (aqueous)	73.3 %	NJ-	Low

QC Limits are 75-125% (soil) and 85-115% (aqueous) for MS recovery; 85-115% for post spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium
£ – The samples associated with QC Batch GP75946 consist of JB52302-1 through -13 (inclusive);
Ж – The samples associated with QC Batch GP75948 consist of JB52302-14 through -26 (inclusive);
€ – The samples associated with QC Batch GN94565 consist of JB52302-27 and -28.

Duplicate Sample Analysis

The duplicate analysis was performed on two sets of duplicate samples. The %RPD values for all QC batches were within the QC limits of 35%RPD for soil samples (USEPA, 2010; AECOM, 2010). Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

In soil and aqueous batches, the recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 84.9% to 100.0%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in any of the three analytical sequences. The hexavalent chromium method does not specify a serial dilution analysis requirement.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

The results for the analysis of the two pairs of field duplicate samples are presented in Table 9, below:

Table 9. Comparison of Field Duplicate Soil Sample Results – SDG JB52302

Analyte	DD011 1.5-2 (mg/Kg)	DUP 16 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	1.3	0.66	< 2 × CRQL	-
Analyte	DD012 5.5-6 (mg/Kg)	DUP17 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	< 0.50	0.48	< 2 × CRQL	-

QC Limit is ≤ 50 %RPD;
< – The analyte was not detected at the stated reporting limit;
J – The reported result is an estimated value;
CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;

< 2 × CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.

The results for the hexavalent chromium concentrations in the field duplicate samples from DD011 1.5-2 and DD012 5.5-6 were similar and, thus, considered representative, as the concentrations between field duplicate samples differed by less than two times the reporting limit value (< 2 × CRQL). The hexavalent chromium results for the two pairs of field duplicate samples, therefore, demonstrate acceptable sampling representativeness and precision.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calibration curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample DD012 2.5-3 (JB52302-16) was listed as 23.3 mg/Kg on the reporting form and 0.5069 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.5069 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00253 \text{ Kg} \times 86.1/100} = \frac{0.05069}{0.002178} = 23.2736 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 23.3 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 23.3 mg/Kg for Sample DD012 2.5-3 was correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 25 soil samples analyzed for Cr+6 in this SDG, JB52302. Thus, this detected Cr⁺⁶ concentration was above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

Most samples were observed to fall below the Eh-pH phase diagram line. These results suggest that many of the samples experience conditions of reducing soil environment. Some of the samples (4 out of 26) fall on or slightly above the Eh-pH phase diagram line. These results

suggest that some of the samples may experience condition of an oxidizing soil environment. However, the reported Cr+6 results of the affected samples are considered acceptable because of two issues, the Cr+6 concentration of the samples in the oxidizing environment are low (<1.3 mg/Kg), while the Cr+6 results of the other samples in the reducing soil are not expected to increase in value because oxidation to Cr+6 is not favorable under reducing soil conditions. Thus, the hexavalent chromium results are considered acceptable as reported with only one hexavalent chromium concentration (23.3 mg/Kg) above the SRS of 20 mg/Kg, as detailed in the text above.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were below QC limits for the soluble matrix spikes associated with QC Batch GP75946 for soil samples JB52302-1 through -13 (inclusive) and GN94565 associated with the two field blanks (JB52302-27 and -28). All other QC results associated with the hexavalent chromium analysis were within QC limits. The Cr⁺⁶ results for the 13 soil samples of SDG JB52302 were qualified following the DV review and flagged with "NJ-", as were the two field blank results below in Table 10.

Table 10. Summary of Qualified Sample Cr⁺⁶ Results in SDG JB52302

Client ID	Laboratory Sample ID	Analyte	Result (mg/Kg)	DV Qualifier
DD009 0.5-1	JB52302-1	Cr ⁺⁶	11.3	NJ-
DD009 2-2.5	JB52302-2	Cr ⁺⁶	14.6	NJ-
DD009 4-4.5	JB52302-3	Cr ⁺⁶	8.7	NJ-
ED007 0.5-1	JB52302-4	Cr ⁺⁶	4.2	NJ-
ED007 2-2.5	JB52302-5	Cr ⁺⁶	1.8	NJ-
ED007 4-4.5	JB52302-6	Cr ⁺⁶	<0.47	NJ-
ED007 6-6.5	JB52302-7	Cr ⁺⁶	4.6	NJ-
ED007 8-8.5	JB52302-8	Cr ⁺⁶	<0.52	NJ-
DUPE 16	JB52302-9	Cr ⁺⁶	0.66	NJ-
DD011 1.5-2	JB52302-10	Cr ⁺⁶	1.3	NJ-
DD011 2.5-3	JB52302-11	Cr ⁺⁶	<0.49	NJ-
DD011 3.5-4	JB52302-12	Cr ⁺⁶	<0.47	NJ-
DD011 4.5-5	JB52302-13	Cr ⁺⁶	<0.49	NJ-
FB06	JB52302-27	Cr ⁺⁶	<0.010 mg/L	NJ-
FB07	JB52302-28	Cr ⁺⁶	<0.010 mg/L	NJ-

Key:
 < –The analyte was analyzed for, but was not detected above the stated reporting limit.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 52302

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No

Indicate the identity of the samples and why. *Matrix interference.*
 (2x) JB 52302 - 1, 2, 4, 5, 10, 17, 19, 21, 25, 26.
 (4x) JB 52302 - 3, 20, 22, 23A.
 (10x) JB 52302 - 8.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

Antimony and thallium in JB 52302 - 8.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

*15 SRS values were exceeded.
 13 results for nickel in JB 52302 - 1, 4, 5, 6, 9, 10, 11, 14, 15
 one antimony in JB 52302 - 24; - 16, 17, 19, 26. Cr⁺⁶ in - 16.*

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

*Refer to DV report discussions of case narrative regarding QC limit exceedances.
 No problems with analytical procedures were noted.*

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, 5, and 8 for details.

Qualified sample results are presented in Tables 7 and 10 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB52401A
Sample Date: November 6, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: March 26, 2014

This data validation (DV) report presents the data review and result qualifications for six (6) soil samples collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 6, 2013 for sample delivery group (SDG) JB52401A. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB52401A were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the six collected soil samples.

- Following the detailed DV review, there were no sample results that warranted qualification, based on the acceptability of the supporting QC data.

Thus, no sample results in SDG JB52401A required qualification, based on the acceptable associated QC results and analytical performance. Details are provided in the sections of text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for nickel, vanadium and hexavalent chromium in JB52401-12, and antimony in sample JB52401-14.

A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The six (6) soil samples collected November 6, 2013, were received November 7, 2013 at the Accutest laboratory in Dayton, NJ with an acceptable sampling cooler temperature of 1°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. intact and chemically preserved on November 7, 2013 with acceptable sampling cooler temperatures of 3.8°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary – SDG JB52401A

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
ED001 0.5-1	JB52401-11	11/6/2013	Soil	Metals, Cr+6
ED001 2-2.5	JB52401-12	11/6/2013	Soil	Metals, Cr+6
ED001 4-4.5	JB52401-13	11/6/2013	Soil	Metals, Cr+6

ED001 8-8.5	JB52401-15	11/6/2013	Soil	Metals, Cr+6
DD005 0.5-1	JB52401-16	11/6/2013	Soil	Metals, Cr+6
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast Inc, in Orlando FL. Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

Data Review

Data, as presented in the analytical data package SDG JB52401A, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (✓) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. The soil sample results exhibited concentrations below the respective site remediation standard (SRS) levels in the 6 soil samples of this SDG, except for the nickel and vanadium in JB52401-12, and antimony in JB52401-14.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS)/matrix spike duplicate (MSD) recoveries were outside QC limits for antimony in QC Batch MP26374 for a non-client sample FA10071-1, indicating possible matrix interference and/or sample non-homogeneity. However, the 75.7% MSD recovery for antimony is actually within the DV QC limits of 75-125% (NJDEP, 2002), while the MS recovery of 74.8% is at the lower control limit after rounding to two significant digits. The case narrative listed, in random order, the various analytes that experienced elevated reporting limits attributable to the dilution of samples during analysis due to matrix interference. No other issues were raised in the case narrative covering the metals analysis at the Orlando, Florida laboratory.

All other QC requirements were met, including analyses for hexavalent chromium, pH, oxidation reduction potential, and total solids analysis. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination).

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks or the continuing calibration blanks at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB52401A.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis (QC Limits 75-125% Recovery; ≤ 35%RPD)

The 74.8% matrix spike and 75.7% matrix spike duplicate (MS/MSD) recoveries were identified as outside [laboratory] QC limits for the non-client QC sample (FA10071-1) in the one identified QC

batch for the six PPG soil samples, but were actually within the data validation QC limits of 75 - 125% when rounded to two significant digits (NJDEP, 2002). Since antimony was detected in three of the six PPG soil samples, the recovery at the low boundary of the QC limit range is judged to not significantly affect the interpretation of the associated antimony results. The one antimony result was above the SRS, even with the 75% spike recovery, indicates that the sample will require remediation or further evaluation. The next highest detected antimony result was 4.8 mg/Kg and it is not expected that there may exist any possible low bias that would significantly affect this concentration that would otherwise elevate it above the SRS value. Thus, professional judgement was applied in not qualifying the antimony results in the associated soil samples, since, additionally, this sample was from a client other than PPG.

Duplicate analysis (QC Limit \leq 35 %RPD)

The duplicate analysis was performed on a non-client QC sample with concentrations that were low, but not different from those observed in PPG soil samples. All %RPD values were below the QC limit of 35%RPD for soil samples, as well as the 20%RPD laboratory QC limit and no results required qualification. The duplicate analyses demonstrated acceptable analytical precision with all RPD values below 18.2%RPD, while the results of the matrix spiked duplicate samples were less than 3.5%RPD.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 94.8% - 105.0% for the soil sample metals analysis, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis (QC Limit \leq 10 %D)

The percent difference (%D) values in the serial dilution analysis were all below the QC limit of 10%D, ranging from 0 to 7.0 %D. Consequently, no soil sample results required qualification.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Antimony (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading ($\mu\text{g/L}$)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The antimony concentration for Sample ED001 6-6.5 (JB52401-14) was listed as 6.6 mg/Kg on the reporting form and 0.1371 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Antimony (mg/Kg)} = \frac{(137.1 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.30 \text{ g}) (79.4/100\%)} = \frac{6,855}{1,032.2} = 6.6412 \mu\text{g/g}$$

= 6.6 mg/Kg, dry weight

After rounding to two significant figures, this verifies that the antimony concentration of 6.6 mg/Kg for Sample ED001 6-6.5 was correctly reported. This concentration marginally exceeded the antimony SRS of 6 mg/Kg.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of five of the six soil samples for metals analysis that had been diluted by a factor of either two or four. However, following dilution, none of the reporting limits exceeded any of the SRS values for the target analytes.

Summary

The soil sample analytical results for the samples of SDG JB52401A were found to be compliant with the analytical methods for the analysis of metals in the six soil samples using SW-846 Method 6010C. The QC criteria were met for the metals target analyte analyses, such that no metals sample results warranted qualification following completion of the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the six soil samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in 5 of the 6 soil samples, with the 21.2 mg/Kg result in JB52401-14 above the SRS of 20 mg/Kg. No Cr+6 results required qualification in this SDG, JB52401A following the DV review.

Case Narrative

The case narrative indicated that all QC requirements were met, and that good recoveries were achieved for the matrix spike analyses. The RPD for Cr+6 was outside QC limits, but was acceptable due to low duplicate and sample concentrations.

Calibrations

The initial calibrations for the various Cr+6 analyses demonstrated an acceptable correlation coefficient with a value of 0.99989, a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered between 93.6% and 97.7% for soil analyses, thereby meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in the method blanks (< 0.40 mg/Kg) or the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The soluble and insoluble matrix spike recoveries for hexavalent chromium, as well as the post-digestion spikes, were below the respective QC limits for the soil QC batch employing PPG sample JB52401-4, a sample from another PPG SDG, thereby demonstrating acceptable accuracy and no hexavalent chromium results were qualified following the DV review. The spike recoveries ranged 80.8 to 91.9%, well within QC limits.

Duplicate Sample Analysis

The duplicate analyses met QC requirements with values less than 1.6 %RPD, including redox potential and pH analyses, except for the 89.8 %RPD value for Cr+6 analysis in QC Batch GP75957. However, the result met QC limits because the difference between the duplicate results was less than two times the CRDL (or reporting limit), the QC limit for soil analysis (USEPA, 2010). Consequently, no sample results associated with this SDG, SDG JB52401A, are subject to qualification for analytical precision issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 92.5% to 99.1%, thereby demonstrating acceptable analytical system performance for the soil analyses.

Sample Result Verification

The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample ED001 2-2.5 (JB52401-12) was listed as 21.1 mg/Kg on the reporting form and 0.4489 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Cr}^{+6} \text{ (mg/Kg)} &= \frac{A \times B \times E}{C \times D} \\ \text{Cr}^{+6} \text{ (mg/Kg)} &= \frac{0.4489 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00246 \text{ Kg} \times 85.9\%/100\%} = \frac{0.04489}{0.0021131} = 21.2437 \text{ mg/Kg} \end{aligned}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 21.2 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 21.2 mg/Kg for Sample ED001 2-2.5 was correctly reported. This was the highest detected Cr+6 concentration detected among the six soil samples of this SDG, JB52401A and the only result detected above the SRS of 20 mg/Kg in this SDG.

pH/Eh (ORP)

The pH and Eh (ORP) data were reviewed and determined to have acceptable QC results and are correctly reported on the sample "Report of Analysis" forms, which essentially serve as the "Form I" for reporting results.

The pH and Eh results were compared to the Eh-pH phase diagrams and verified that the sample points are correctly located on the diagrams. All sample results were observed to fall under the Eh-pH phase diagram line, thereby demonstrating "reducing" conditions. Hexavalent chromium was detected in five of the six soil samples of JB52401A at concentrations of 16.2 mg/Kg or less, except for the 21.2 mg/Kg Cr+6 result in Sample JB52401-12, which was the only Cr+6 result above the SRS of 20 mg/Kg.

Summary of Hexavalent Chromium Results in SDG JB52401A

The soil sample analytical results for the samples of SDG JB52401A met all QC requirements of the hexavalent chromium analyses, such that no sample Cr+6 results required qualification.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
EJ	The reported value is estimated because of the presence of interference.

Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 52401 A

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times
(for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

(2x) JB 52401 - 11, 14, 16

(4x) JB 52401 - 13, 15

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Nickel, vanadium and Cr⁺⁶ in JB 52401 - 12

Antimony in JB 52401 - 14.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No analytical procedural problems were noted

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No

Provide a brief explanation.

Not applicable

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report text for details.

No sample results warranted qualification.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB52631
Sample Date: November 8, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: February 7, 2014

This data validation (DV) report presents the data review and result qualifications for thirty-five (35) soil samples and one field blank (FB) collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 8, 2013 for sample delivery group (SDG) JB52631. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB52631 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 35 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony ("NJ-") in Samples JB52631-1 through -6 (inclusive), and JB52631-8 through -36 (inclusive);
- Chromium ("ENJ+") in Samples JB52631-1 through -6 (inclusive), and JB52631-8 through -21 (inclusive);
- Chromium ("ENJ-") in Samples JB52631-22 through -36 (inclusive);
- Nickel ("EJ") in Samples JB52631-1 through -6 (inclusive), and JB52631-8 through -36 (inclusive);
- Nickel ("NJ-") in Sample JB52631-7 (field blank);
- Vanadium ("EJ") in Samples JB52631-1 through -6 (inclusive), and JB52631-8 through -21 (inclusive);
- Vanadium ("*ENJ-") in Samples JB52631-22 through -36 (inclusive).

No other sample results in SDG JB52631 required qualification, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for five nickel results and one antimony result.

The sample results that were subject to qualification following the DV review are presented in Table 6 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The thirty-five (35) soil samples and one field blank collected November 8, 2013, were received the same day at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 5°C, a temperature below the 10 °C criterion above which some DV guidelines recommend qualification of associated samples, as well as below the 6 °C guideline for hexavalent chromium (NJDEP, 2005). The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. preserved and in good condition with on November 12, 2013 with sampling cooler temperatures of 3.3°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary – SDG JB52631

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories SE in Orlando, FL;
Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB52631, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. The soil sample results

exhibited concentrations below the respective site remediation standard (SRS) levels in the 35 soil samples of this SDG, except for five nickel results and one antimony result.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) recoveries were outside QC limits for antimony, chromium, and vanadium in QC Batch MP26392, as was the matrix spike duplicate (MSD) recovery for antimony. However, the 79.9% MS recovery for vanadium is actually within the DV QC limits of 75-125% (NJDEP, 2002). The serial dilution results were outside QC limits for chromium, nickel, and vanadium in both soil QC batches, MP26392 and MP26393. The MS recoveries for antimony and chromium, and the MSD recoveries for antimony, chromium, nickel, and vanadium were identified as being outside QC limits in MP26393, although the 79.2% MSD recovery for nickel and the 122.3% chromium MS recovery were also within the DV QC limits. The case narrative identified the RPD values in the duplicate analysis as being above the QC limit for chromium, nickel, and vanadium in MP26393. However, the RPD values for chromium and nickel were below the 35%RPD DV QC limit for soil samples for chromium and nickel and, thus, were not subject to qualification following the DV review.

The case narrative also identified that the MS recovery for the QC batch (MP26380) associated with the field blank was outside QC limits.

All other QC requirements were met, including analyses for hexavalent chromium, pH, oxidation reduction potential, and total solids analysis. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

The QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits for the reported sample analyses, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except as noted in the discussion below.

There were some instances where the internal standard area counts were above the stated QC limits, including samples JB52631-13, -19 and JB52631-33 (analyzed as QC sample), and some of the associated QC samples (MS/MSD and the duplicate). However, based on control charts within the laboratory, the QC limit range has been updated to 70-130%. Consequently, the two of the affected samples in MA11222, JB52361-13 (127.2%) and JB52361-19 (125.8%) were not reanalyzed, as the IS area counts are below 130% and considered acceptable. The IS#1 (129%) and IS#2 (130.7%) of JB52631-33 were near the 130% upper calibration limit. Thus, the IS#1 for antimony was within the updated QC limits, while the IS#2 for JB52631 was still above QC limits. Consequently, the chromium and vanadium results for this sample are subject to qualification. However, since Sample JB52631-33 does not appear to have been reanalyzed, the chromium and vanadium results for JB52631-33 are subject to qualification. The chromium and vanadium in Sample JB52361-33 are qualified as estimated values and flagged with "ENJ-" and "*ENJ-", respectively, as are the results in the associated samples of the QC batch. Consequently, the chromium and vanadium results did not warrant additional flagging for the IS area count calibration issue.

The closing CRDL standard (CRIA4) recovery for antimony was 62%, a value below the DV QC limits of 70-130%. There was only one PPG sample analyzed in the affected sequence, JB53621-5. Since antimony was not detected in this sample that was diluted by a factor of 20, the reporting limit was above the affected range (true spike \pm CRQL) prior to adjustment for the dilution, such that the antimony result in JB53621-5 was not subject to qualification (USEPA, 2010). Furthermore, the analysis of a CRI standard is not a requirement of the analytical method.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB52631.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; \leq 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries were within the QC limits of 75 - 125% for QC samples in the three identified QC batches, except for those recoveries identified below in Table 2.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26392 Ω	JB52631-1	Antimony	30.9 %	26.2 %	NJ-	Low
MP26392 Ω	JB52631-1	Chromium	160.0 %	185.8%	NJ+	High
MP26392 Ω	JB52631-1	Vanadium	79.9 %	96.2 %	----	----
MP26393 \dagger	JB52631-33	Antimony	17.1 %	16.6 %	NJ-	Low
MP26393 \dagger	JB52631-33	Chromium	122.3 %	73.1 %	NJ-	Low
MP26393 \dagger	JB52631-33	Vanadium	87.8 %	74.5 %	NJ-	Low
MP26380 Θ	FA9783-1	Nickel	74.0 %	80.0 %	NJ-	Low

QC Limits are 75-125%;
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate.
 Ω – The samples associated with QC Batch MP26392 consist of JB52631-1 through -6, and JB52631-8 through -21 (inclusive);
 \dagger – The samples associated with QC Batch MP26393 consist of JB52631-22 through -36 (inclusive);
 Θ – The samples associated with QC Batch MP26380 consist of JB52631-7 (field blank).

The MS and MSD recoveries outside QC limits in Table 2 indicate possible matrix interference and/or possible sample non-homogeneity.

The antimony results in all of the 35 affected soil samples are flagged with “NJ-” due to a potential low bias, while the chromium results flagged with “NJ+” in samples associated with QC batch MP26392 may exhibit a potential positive bias in the identified samples. The chromium and

vanadium results flagged with "NJ-" in samples associated with QC batch MP26393 may exhibit a potential low bias in the identified samples. The field blank in QC Batch MP26380 was associated with non-client QC batch sample that experienced a MS recovery marginally below the QC limits of 75-125% (NJDEP, 2002). The nickel result in the field blank was qualified as an estimated value and flagged with "NJ-". These individual qualified sample results are presented below in summary table, Table 6, together with the sample results qualified for the duplicate analysis and serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The case narrative identified the RPD values in the duplicate analysis as being above the QC limit for chromium, nickel, and vanadium in MP26393 due to possible sample non-homogeneity. However, the RPD values for chromium and nickel were below the 35%RPD QC limit for technical data quality assessment in DV guidelines (USEPA, 2010), such that only the vanadium results associated with this QC batch are subject to qualification for analytical precision issues. Thus, the chromium and nickel results associated with MP26393 were not subject to qualification following the DV review. All remaining %RPD values were below the QC limits of either 35%RPD or < 2 × CRQL for soil samples and, thus, no other results required qualification.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
MP26393 †	JB52631-33	Vanadium	38.1 %D	*J
QC Limit is 35%RPD; *J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction. † – The samples associated with QC Batch MP26393 consist of JB52631-22 through -36 (inclusive).				

Thus, following the DV review, the vanadium results associated with QC Batch MP26393 are qualified as estimated values and are to be flagged with "*J" due to the potential variability in the analytical precision as indicated in Table 3, due possibly to sample non-homogeneity, though without exhibiting any clear bias direction. When the "*J" qualifiers are combined with the qualifiers associated with the low vanadium MSD recovery and elevated serial dilution result in the QC sample of this batch, the vanadium results appear with "*ENJ-" in the summary table, Table 6. Aside from the vanadium results in QC Batch MP26393, the remaining duplicate analyses demonstrated acceptable analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 94.4% - 104.0% for the soil sample metals analysis, and 97.5 to 103.0% for the aqueous analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the serial dilution results being outside QC limits for chromium, nickel and vanadium in both QC batches and stated that the difference indicates matrix interferences. Thus, the affected chromium, nickel and vanadium results in the samples associated with these %D exceedances were subject to qualification following the DV review, as discussed below. These QC results are detailed in Table 4 below.

The case narrative also stated that the RPDs for antimony and thallium are outside QC limits in some QC batches, but that the percent difference values were acceptable due to the low initial sample concentration (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010).

Table 4. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26392 Ω	JB52631-1	Chromium	18.2 %D	EJ
MP26392 Ω	JB52631-1	Nickel	19.0 %D	EJ
MP26392 Ω	JB52631-1	Vanadium	16.8 %D	EJ
MP26393 †	JB52631-33	Chromium	47.1 %D	EJ
MP26393 †	JB52631-33	Nickel	50.6 %D	EJ
MP26393 †	JB52631-33	Vanadium	45.3 %D	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
 Ω – The samples associated with QC Batch MP26392 consist of JB52631-1 through -6, and JB52631-8 through -21 (inclusive);
 † – The samples associated with QC Batch MP26393 consist of JB52631-22 through -36 (inclusive).

The associated chromium, nickel, and vanadium results in samples with laboratory sample ID numbers identified in Table 4 for the associated samples are qualified as estimated values and flagged with "EJ" to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 6, along with the results qualified for matrix spike recoveries outside QC limits and the duplicate analysis.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Antimony (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The antimony concentration for Sample ED003 4-4.5 (JB52631-35) was listed as 87.5 mg/Kg on the reporting form and 1.787 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Antimony (mg/Kg)} = \frac{(1,787 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.22 \text{ g})(83.5/100\%)} = \frac{89,150}{1,018.7} = 87.5135 \mu\text{g/g}$$

= 87.5 mg/Kg, dry weight

After rounding to three significant figures, this verifies that the antimony concentration of 87.5 mg/Kg for Sample ED003 4-4.5 was correctly reported. This concentration exceeded the antimony SRS of 6 mg/Kg.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 20 of the 35 soil samples that had been diluted by a factor of either two, four, five, ten, or 20.

The reporting limits for the target analytes determined for the ICP analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where four samples were diluted by a factor of 10×, while three samples were subjected to a 20× dilution, thereby raising the reporting limit for the antimony and thallium results above the respective SRS, as presented below in Table 5, diluted apparently due to elevated levels of nickel in the samples, or due to appearance of the sample or digestate.

Table 5. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
ED004 6-6.5	JB52631-5	Antimony	< 0.95	20	< 19	6
ED004 6-6.5	JB52631-5	Thallium	< 0.48	20	< 9.6	3
DD001 6-6.5	JB52631-16	Antimony	< 0.8	20	< 16	6
DD001 6-6.5	JB52631-16	Thallium	< 0.4	20	< 7.9	3
DD001 8-8.5	JB52631-17	Antimony	< 0.7	20	< 14	6
DD001 8-8.5	JB52631-17	Thallium	< 0.34	20	< 6.9	3
DD002 5-5.5	JB52631-20	Antimony	< 1.1	10	< 11	6
DD002 5-5.5	JB52631-20	Thallium	< 0.56	10	< 5.6	3
DD004 8-8.5	JB52631-27	Antimony	< 0.8	10	< 8.0	6
DD004 8-8.5	JB52631-27	Thallium	< 0.4	10	< 4.0	3
DD003 8-8.5	JB52631-32	Antimony	< 0.86	10	< 8.6	6
DD003 8-8.5	JB52631-32	Thallium	< 0.43	10	< 4.3	3
ED003 2-2.5	JB52631-34	Antimony	< 0.78	10	< 7.8	6
E003 2-2.5	JB52631-34	Thallium	< 0.39	10	< 3.9	3

Units – mg/Kg

< - The analyte was analyzed for, but was not detected above the stated reporting limit.

Unlike other SDGs where the raised reporting limits of antimony and thallium were associated with samples exhibiting concentrations of other analytes that exceeded an SRS value, most of these samples were diluted seemingly because of sample/digestate appearance. Consequently, the samples identified in Table 6, except for JB52631-5 which exhibited a nickel result above its SRS of 31 mg/Kg, did not exhibit any results above an SRS value.

Summary

The soil sample analytical results for the samples of SDG JB52631 were found to be compliant with the analytical methods for the analysis of metals in the thirty-five soil samples and one field blank using SW-846 Method 6010C.

The QC criteria were met for the metals target analyte analyses, except for the low matrix spike recoveries for antimony in the two QC batches associated with 35 soil samples. Low MS and/or MSD recoveries were also observed for chromium and vanadium in samples associated with QC Batch MP26393 (samples JB52631-22 through -36), while the MS/MSD recoveries for chromium were above QC limits associated with samples JB52631-1 through -6 and JB52631-8 through -21 and are flagged with "NJ+" suggesting a potential positive bias. The nickel result in the field blank (FB 08) is qualified as an estimated value and flagged with "NJ-" due to the marginally low MS recovery in the associated QC sample.

The duplicate analysis for vanadium in QC Batch MP26393 was outside QC limits indicating potential variability in the analytical precision in associated samples (*J), possibly attributable to sample non-homogeneity.

The serial dilution result for chromium, nickel and vanadium in the QC samples of both QC batches associated with the 35 soil samples were above the QC limit of 10.0 %D, suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the identified chromium, nickel and vanadium results are qualified as estimated values and are flagged with "EJ" in 35 samples, as presented below in Table 6.

Table 6. Summary Qualified Sample Metals Results in SDG JB52631

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
ED003 8-8.5	JB52631-1	Antimony	1.7	NJ-
ED003 8-8.5	JB52631-1	Chromium	30.0	ENJ+

Key:

< – The analyte was analyzed for, but was not detected above the stated reporting limit.

NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.

NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.

*J – Duplicate analysis not within control limits; estimated value with an indeterminate bias direction.

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one batch for the field blank.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in 18 of the 35 soil samples, but at reported concentrations below 4.7 mg/Kg, all values below the SRS of 20 mg/Kg. No Cr+6 results required qualification.

Case Narrative

The case narrative indicated that all QC requirements were met, and that good recoveries were achieved for the matrix spike analyses.

Calibrations

The initial calibrations for the various Cr+6 analyses demonstrated acceptable correlation coefficients with values of at least 0.99971, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered between 91.1% and 96.3% for soil

analyses and values of 99.1% for the FB analysis, thereby meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in the method blanks (< 0.40 mg/Kg), continuing calibration blanks or field blank (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The soluble and insoluble matrix spike recoveries for hexavalent chromium, as well as the post-digestion spikes, were below the respective QC limits for both soil QC batches, as well as the aqueous sample batch, thereby demonstrating acceptable accuracy and no hexavalent chromium results were qualified following the DV review. The spike recoveries ranged 87.9% to 107.3%, well within QC limits.

Duplicate Sample Analysis

All duplicate analyses met QC requirements with values less than 19.3 %RPD, including Cr+6, redox potential and pH analyses, except for the 27.0 %RPD value in QC Batch GP76039, a value still below the suggested 35%RPD QC limit for soil analysis (USEPA, 2010). Consequently, no sample results associated with this SDG, SDG JB52631, are subject to qualification for analytical precision issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 92.4% to 104.9%, thereby demonstrating acceptable analytical system performance for both the soil and aqueous analyses.

Sample Result Verification

The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample DD003 0.5-1 (JB52631-28) was listed as 4.7 mg/Kg on the reporting form and 0.1057 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.1057 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00258 \text{ Kg} \times 87.6\%/100\%} = 4.6772 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 4.7 \text{ mg/Kg}$$

After rounding to two significant figures, this verifies that the hexavalent chromium concentration of 4.7 mg/Kg for Sample DD003 0.5-1 was correctly reported. This was the highest detected Cr+6 concentration detected among the thirty-five soil samples of this SDG, JB52631. Thus, all Cr+6 results are under the SRS of 20 mg/Kg.

pH/Eh (ORP)

The pH and Eh (ORP) data were reviewed and determined to have acceptable QC results and are correctly reported on the sample "Report of Analysis" forms, which essentially serve as the "Form I" for reporting results.

The pH and Eh results were compared to the Eh-pH phase diagrams and verified that the sample points are correctly located on the diagrams. All sample results were observed to fall under the Eh-pH phase diagram line, thereby demonstrating "reducing" conditions, except for JB52631-18 whose Cr+6 concentration was only 4.3 mg/Kg. Hexavalent chromium was detected in 18 of the 35 soil samples of JB52631 at concentrations of 4.7.0 mg/Kg or less, thus, were all below the SRS of 20 mg/Kg.

Summary of Hexavalent Chromium Results in SDG JB52631

The soil sample analytical results for the samples of SDG JB52631 met all QC requirements of the hexavalent chromium analyses, such that no sample Cr+6 results required qualification.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference.

Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 52631

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? for metals analysis Yes No
Indicate the identity of the samples and why. Matrix interference

(2x) JB52631-6, 8, 14, 28; (4x) JB52631-15;
 (5x) JB52631-2, 3, 18, 21, 22, 23, 24, 29; (20x) JB52631-5, 16, 17.
 (10x) JB52631-20, 27, 32, 34.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

Antimony and thallium in JB 52631-5, 16, 17, 20, 27, 32, 34.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Five nickel results: JB 52631-5, 6, 9, 11, 23
 one antimony: JB 52631-35.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.
 No problems with analytical procedures were noted.

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
 Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
 If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
 Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, and 4, as well as a brief discussion regarding calibration results in the DV report.

Qualified sample results are presented in Table 6 of the data validation report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB53021
Sample Date: November 12 and 13, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewers: Faiza M. Botros
Janis V. Giga, Ph.D., REP 5554
Report Date: February 12, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-six (26) soil samples collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 12 and 13, 2013 for sample delivery group (SDG) JB53021. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53021 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 26 collected soil samples.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53021-1 through -26 (inclusive);
- Chromium (NJ-) in Samples JB53021-1 through -8 (inclusive), and JB53021-17 and -18;
- Chromium (EJ) in Samples JB53021-9 through -16, and JB53021-19 through -26 (inclusive);
- Nickel (ENJ-) in Samples JB53021-9 through -26 (inclusive);
- Vanadium (ENJ-) in Samples JB53021-9 through -26 (inclusive);
- Hexavalent Chromium (NJ-) in Samples JB53021-1 through JB53021-13 (inclusive).

No other sample results in SDG JB53021 required qualification. Details are provided in the tables and text below. All but one of the target metals (nickel in JB53021-14) were reported below the respective site remediation standard (SRS) limits, while six (6) hexavalent chromium results exceeded the SRS value of 20 mg/Kg.

The individual sample results that were qualified following the DV review are identified in Tables 6 and 9 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The twenty-six (26) soil samples collected on November 12 and 13, 2013, were received

November 13, 2013 at the Accutest laboratory in Dayton, NJ intact and chemically preserved with acceptable sampling cooler temperatures of 2°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. on November 16, 2013 in properly preserved and intact with sampling cooler temperatures of 3.4°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast in Orlando, FL.
 Cr⁺⁶ – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB53021, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgment, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. No sample results exhibited concentrations above the respective site remediation standard (SRS) levels in any of the 26 soil samples of this SDG, except for one nickel result in GI002 8-8.5.

Laboratory Case Narrative

The case narrative stated that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony, nickel, and vanadium were identified as being outside QC limits in QC batches MP26409 and antimony, chromium and vanadium in the MSD analysis of MP26410. The MS/MSD recoveries of antimony, chromium, nickel, thallium and vanadium were identified as being outside control limits in QC Batch MP26415. The case narrative identified the serial dilution results for chromium, nickel and vanadium as being outside QC limits in QC Batch MP26409 and MP26415. However, the initial chromium concentration in the QC sample of MP26415 was actually less than 50 times the IDL, and thus, not subject to qualification during the DV review. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There were, however, two exceptions.

The antimony recoveries in the closing "CRI" standards of analytical sequences MA11229 and MA11230 recovered slightly below the 70-130% control limits. One soil sample was associated with the first sequence, while eight undiluted samples were analyzed in MA11230. However, it was observed that the detected concentrations and reporting limits for the non-detect results were all above the "affected range" (true spike \pm CRQL) for each of the associated samples and, consequently, no sample antimony results are subject to qualification (USEPA, 2010). Thus, no soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks or the continuing calibration blanks at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53201.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis (QC Limits 75-125% Recovery; \leq 35%RPD)

The case narrative stated that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony, nickel, and vanadium were identified as being outside QC limits in QC Batch MP26409 and antimony, chromium and vanadium in the MSD analysis of MP26410. The MS/MSD recoveries of antimony, chromium, nickel, thallium and vanadium were identified as being outside control limits in QC Batch MP26415. However, upon closer inspection of the data, it was learned that the MSD recovery for nickel in MP26409 and vanadium in the MSD analysis of MP26410 were actually within the 75-125% DV QC limits, as can be seen in Table 2 below, as were the MS/MSD recoveries for thallium in QC Batch MP26415.

The MS and MSD recoveries for the various analytes were outside QC limits of 75 - 125% for QC samples in the three identified QC batches which are summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential or low bias in the ability to recover the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26409 Ω	JB53021-9	Antimony	23.8 %	25.3 %	NJ-	Low
MP26409 Ω	JB53021-9	Nickel	73.7 %	75.2%	NJ-	Low
MP26409 Ω	JB53021-9	Vanadium	64.4 %	66.1 %	NJ-	Low
MP26410 †	JB53586-1	Antimony	25.6 %	24.5 %	NJ-	Low
MP26410 †	JB53586-1	Chromium	94.9 %	70.3 %	NJ-	Low
MP26415 ϕ	FA10005-8	Antimony	58.3 %	59.4 %	NJ-	Low
MP26415 ϕ	FA10005-8	Chromium	32.9 %	32.8 %	NJ-	Low
MP26415 ϕ	FA10005-8	Nickel	14.5 %	17.1 %	NJ-	Low
MP26415 ϕ	FA10005-8	Vanadium	55.6 %	56.4 %	NJ-	Low

QC Limits are 75-125%;
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate.
 Ω – The samples associated with QC Batch MP26409 consist of JB53021-9 through -16 (inclusive), and JB53021-19 through -26 (inclusive);
 † – The samples associated with QC Batch MP26410 consist of JB53021-1 through -8 (inclusive).
 ϕ – The samples associated with QC Batch MP26415 consist of JB53021-17 and -18.

The antimony results in all of these affected samples (JB53021-1 through -26) are qualified as estimated values and flagged with "NJ-" due to a potential low bias. The chromium results in JB53021-1 through -8, JB53021-17 and -18 are flagged with "NJ-", while the nickel and vanadium results in soil samples JB53021-9 through -26 (inclusive) are also qualified as estimated values and flagged "ENJ-" in conjunction with the serial dilution results that were above the 10%D QC limit. These qualified results are presented below in summary table, Table 6, together with the sample results qualified for serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on three samples analyzed in duplicate and three pairs of samples spiked duplicate samples. All %RPD values were below the QC limit of 35%RPD, with values ranging 0-21.3%RPD for soil samples and no results required qualification. The duplicate analyses demonstrated very good analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 92.0% - 104.0% for the soil sample metals analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the serial dilution results for chromium, nickel and vanadium as being outside QC limits in QC Batch MP26409 and stated that the differences indicates matrix interferences, while the nickel and vanadium results were above the QC limit in MP26415. Thus, the affected chromium, nickel and vanadium results in the samples associated with this elevated %D values are subject to qualification following the DV review. These QC results are detailed in Table 3 below.

Table 3. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26409 Ω	JB53021-9	Chromium	28.7 %D	EJ
MP26409 Ω	JB53021-9	Nickel	26.7 %D	EJ
MP26409 Ω	JB53021-9	Vanadium	27.6 %D	EJ
MP26415 ϕ	FA10005-8	Nickel	33.2 %D	EJ
MP26415 ϕ	FA10005-8	Vanadium	30.5 %D	EJ

Note –
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Ω – The samples associated with QC Batch MP26409 consist of JB53021-9 through -16 (inclusive), and JB53201-19 through -26 (inclusive);
ϕ – The samples associated with QC Batch MP26415 consist of JB53021-17 and -18.

The associated chromium, nickel and vanadium results in samples with laboratory sample ID numbers ranging JB53021-9 through -16, and JB53021-19 through -26, inclusive, are qualified as estimated values and flagged with “EJ” or “ENJ-” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The nickel and vanadium results in JB53021-17 and -18 are flagged with “ENJ-”. The individual qualified results are presented in the summary table, Table 6, along with the results qualified for matrix spike recoveries outside QC limits.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

One set of field duplicate samples was collected as part of SDG JB53021. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2012), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of the one pair of field duplicate samples are presented in Table 4, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples from ID010 8-8.5 were very similar and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 30 %RPD or differed by less than two times the reporting limit value (< 2 × CRQL) for all analyte pairs.

Table 4. Comparison of Field Duplicate Soil Sample Results – SDG JB53021

Analyte	ID010 8-8.5 (mg/Kg)	DUP 17 (mg/Kg)	% RPD	DV Flag
Antimony	< 1.8 NJ-	< 2.0 NJ-	< 2 × CRQL	-
Chromium	10 EJ	12.1 EJ	19.0 %	-
Nickel	7.9 ENJ-	10.6 ENJ-	29.2 %	-
Thallium	< 0.90	< 2.0	< 2 × CRQL	-
Vanadium	14.9 ENJ-	19.1 ENJ-	24.7 %	-
<p>< – The analyte was not detected at the stated reporting limit; J – The reported result is an estimated value; NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low; EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction. CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit; < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.</p>				

The metals results for the pair of field duplicate samples, therefore, demonstrate excellent sampling representativeness and precision.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Nickel (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The nickel concentration for Sample GI002 8-8.5 (JB53021-14) was listed as 41.7 mg/Kg on the reporting form and 0.7834 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Nickel (mg/Kg)} &= \frac{(783.4 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.10 \text{ g})(85.4/100\%)} = \frac{39,170}{939} = 41.6968 \mu\text{g/g} \\ &= 41.7 \text{ mg/Kg, dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the nickel concentration of 41.7 mg/Kg for Sample GI002 8-8.5 was correctly reported. This was the only metals analyte result that exceeded an SRS value.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 17 of the 26 soil samples that had been diluted by a factor of either two, four, five, or ten.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where one sample was diluted by a factor of 10x, thereby raising the reporting limit for the antimony and thallium results above the respective SRS, as presented below in Table 5, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 5. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result (mg/Kg)	Remediation Standard
LD006 9.5-10	JB53021-26	Antimony	< 1.0	10	< 10 NJ-	6
LD006 9.5-10	JB53021-26	Thallium	< 0.50	10	< 5.0	3
Units – mg/Kg						
< - The analyte was analyzed for, but was not detected above the stated reporting limit.						
NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.						

The other analyte results associated with the non-detect soil results of antimony and thallium in JB53021-26 were all below the respective SRS values, including the 0.46 mg/Kg Cr+6 result, thereby suggesting a reasonably “clean” sample.

The interpretation of the antimony (< 10 mg/Kg) and thallium result (<5.0) in JB53021-26 was not significantly compromised by the applied dilution, since the other target analytes in the sample were considerably below their respective SRS values, such that it is likely that the raw amounts of antimony and thallium were similarly not elevated.

Summary

The soil sample analytical results for the samples of SDG JB53021 were found to be compliant with the analytical methods for the analysis of metals in the twenty-six soil samples using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries, and differences in the serial dilution analysis, as summarized in Tables 2 and 3. The associated sample results are qualified accordingly and listed in Table 6 below. Sample analyte results are flagged with either “NJ-”, “EJ”, or “ENJ-”.

Table 6. Summary of Qualified Sample Metals Results in SDG JB53021

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
LD007 4-4.5	JB53021-1	Antimony	< 0.95	NJ-
LD007 4-4.5	JB53021-1	Chromium	23.7	NJ-
LD007 5-5.5	JB53021-2	Antimony	< 4.0	NJ-
LD007 5-5.5	JB53021-2	Chromium	43.9	NJ-
LD007 6-6.5	JB53021-3	Antimony	< 4.2	NJ-

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
LD007 6-6.5	JB53021-3	Chromium	17.6	NJ-
LD007 7-7.5	JB53021-4	Antimony	< 3.9	NJ-
LD007 7-7.5	JB53021-4	Chromium	15.0	NJ-
LD007 8-8.5	JB53021-5	Antimony	< 4.1	NJ-
LD007 8-8.5	JB53021-5	Chromium	12.1	NJ-

LD006 9.5-10	JB53021-26	Vanadium	30.9	ENJ-

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.

N J- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Field duplicate sample analysis |
| √ Quantitation checks | √ Data qualifiers |
| √ Data package completeness | |

Hexavalent chromium was detected in 23 of 26 soil samples analyzed in SDG JB53021. Cr⁺⁶ results had exceeded the SRS of 20 mg/Kg in six (6) soil samples.

Case Narrative

The case narrative indicated that the QC requirements were met for issues such as holding time and method blanks. However, the soluble matrix spike recovery in QC Batch GP76102 was below the QC limits. Good MS recoveries and post spike recovery (100%) were observed for this sample. However, the RPD value for the duplicate sample analysis was acceptable. All other QC requirements were met for the associated samples.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient with value of 0.99990, value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 90.5% to 92.5% for the two QC batches associated with the 26 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in any of the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All but one of the matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 7. Thus, hexavalent chromium results in soil samples associated with QC batch GP76102 required qualification based on the results of the MS recoveries due to potential low bias in the ability to recover Cr⁺⁶ in the associated sample matrix.

Table 7. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76102 £	JB53021-8	Cr ⁺⁶ , soluble	67.1 %	NJ-	low
GP76102 £	JB53021-8	Cr ⁺⁶ , insoluble	91.0 %	----	----

GP76102 £	JB53021-8	Cr ⁺⁶ , post-digestion spike	92.1 %	----	----
GP76103 Ж	JB53021-16	Cr ⁺⁶ , soluble	89.3 %	----	----
GP76103 Ж	JB53021-16	Cr ⁺⁶ , insoluble	88.7 %	----	----
GP76103 Ж	JB53021-16	Cr ⁺⁶ , post-digestion spike	100 %	----	----

QC Limits are 75-125% (soil) and 85-115% (aqueous) for MS recovery; 85-115% for post spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium
NJ- — The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
£ – The samples associated with QC Batch GP76102 consist of JB53021-1 through -13 (inclusive);
Ж – The samples associated with QC Batch GP76103 consist of JB53021-14 through -26 (inclusive).

Duplicate Sample Analysis

The duplicate analysis was performed on two sets of duplicate samples. The %RPD values for all QC batches were within the QC limits of 35%RPD for soil samples (USEPA, 2010; AECOM, 2010). Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 92.4% to 96.8%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in any of the two analytical sequences.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

The results for the analysis of the one pair of field duplicate samples are presented in Table 8, below.

Table 8. Comparison of Field Duplicate Soil Sample Results – SDG JB53021

Analyte	ID010 8-8.5 (mg/Kg)	DUP 17 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	0.79	0.83	< 2 × CRQL	-

QC Limit is ≤ 50 %RPD;
CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;
< 2 × CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.

The results for the hexavalent chromium concentrations in the field duplicate samples from ID010 8-8.5 were very similar and, thus, considered representative, as the concentrations between field duplicate samples differed by less than two times the reporting limit value (< 2 × CRQL). Excellent sampling representativeness and precision was demonstrated by the pair of field duplicate soil samples from ID010 8-8.5.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids

during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample GI003 7.5-8 (JB53021-8) was listed as 167 mg/Kg on the reporting form and 0.3708 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.3708 \text{ mg/L} \times 0.1 \text{ L} \times 10}{0.00249 \text{ Kg} \times 89.1/100} = \frac{0.3708}{0.002218} = 167.178 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 167 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 167 mg/Kg for Sample GI003 7.5-8 was correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 26 soil samples of this SDG JB53021. Thus, this detected Cr⁺⁶ concentration result was above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

Most samples were observed to fall below the Eh-pH phase diagram line. These results suggest that many of the samples experience conditions of reducing soil environment. Some of the samples (3 out of 26) fall on or slightly above the Eh-pH phase diagram line. These results suggest that some of the samples may experience condition of an oxidizing soil environment. However, the reported Cr+6 results of the affected samples are considered acceptable because of two issues, the Cr+6 concentration of the samples in the oxidizing environment are below the SRS (20 mg/Kg) except for sample JB53021-16 (25.2 mg/Kg). The Cr+6 results of the other samples in the reducing soil are not expected to increase in value because oxidation to Cr+6 is not favorable under reducing soil conditions. Thus, the hexavalent chromium results are considered acceptable as reported with the highest hexavalent chromium concentration (167 mg/Kg) above the SRS of 20 mg/Kg, as detailed in the text above.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were below QC limits for the soluble matrix spikes, as all other QC results associated with the hexavalent chromium analysis were within QC limits. The Cr⁺⁶ results for the 13 samples of SDG JB53021 were qualified following the DV review and flagged with "NJ-".

Table 9. Summary of Qualified Sample Cr⁺⁶ Results in SDG JB53021

Client ID	Laboratory Sample ID	Analyte	JB53021 Result (mg/Kg)	DV Qualifier
LD007 4-4.5	JB53021-1	Cr ⁺⁶	8.9	NJ-
LD007 5-5.5	JB53021-2	Cr ⁺⁶	5.5	NJ-
LD007 6-6.5	JB53021-3	Cr ⁺⁶	3.2	NJ-
LD007 7-7.5	JB53021-4	Cr ⁺⁶	<0.45	NJ-
LD007 8-8.5	JB53021-5	Cr ⁺⁶	0.82	NJ-
GI003 5.5-6	JB53021-6	Cr ⁺⁶	124	NJ-
GI003 6.5-7	JB53021-7	Cr ⁺⁶	124	NJ-
GI003 7.5-8	JB53021-8	Cr ⁺⁶	167	NJ-
GI003 8.5-9	JB53021-9	Cr ⁺⁶	91.0	NJ-
GI003 9.5-10	JB53021-10	Cr ⁺⁶	<0.57	NJ-
GI002 5-5.5	JB53021-11	Cr ⁺⁶	85.4	NJ-
GI002 6-6.5	JB53021-12	Cr ⁺⁶	4.2	NJ-
GI002 7-7.5	JB53021-13	Cr ⁺⁶	15.4	NJ-
NJ- — The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.				

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 53021

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No

Indicate the identity of the samples and why. *Matrix interference*
metals 2x JB 53021 - 7, 8, 13, 19, 20, 21, 22, 23.
 4x JB 53021 - 2, 3, 4, 5, 6, 17, 24
 5x JB 53021 - 18
 10x JB 53021 - 26 *Cr+6 (10x): JB 53021 - 6, 7, 8, 9, 11.*

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No

If "Yes", list the affected samples.
Antimony and thallium in JB 53021 - 26

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Nickel in JB 53021 - 14
Cr+6 in JB 53021 - 6, 7, 8, 9, 11, and 16.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.
No analytical procedures problems were noted.

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*

10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, and 7 for details.

Qualified sample results are presented in Tables 6 and 9 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB53174 and JB53174R.

Sample Date: November 14, 2013

Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97

Reviewer: Faiza M. Botros
Janis V. Giga, Ph.D., REP 5554

Report Date: February 27, 2014

This data validation (DV) report presents the data review and result qualifications for five soil samples and three (3) Field Blank aqueous samples collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 14, 2013 for sample delivery group (SDG) JB53174. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53174 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 5 collected soil samples and three Field Blank aqueous samples.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53174-4 through -8 (inclusive).
- Chromium (*J) in Samples JB53174-4 through -8 (inclusive);
- Hexavalent chromium (NJ-) in Samples JB53174-4 through -8 (inclusive);

No other sample results in SDG JB53174 required qualification for hexavalent chromium results, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for two nickel results. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The five (5) soil and three (3) Field Blank samples collected on November 14, 2013, were received November 14, 2013 at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 2.3°C. The samples destined for metals analysis were received at the Orlando laboratory on November 19, 2013 properly preserved with a sampling cooler temperature of 3.4 °C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Client Sample Designation	Sample Lab ID Number	Date Collected	Matrix	Analyses
ID008 0-0.5	JB53174-4	11/14/13	Soil	Metals, Cr ⁺⁶
ID008 2-2.5	JB53174-5	11/14/13	Soil	Metals, Cr ⁺⁶
ID008 4-4.5	JB53174-6	11/14/13	Soil	Metals, Cr ⁺⁶
ID008 6-6.5	JB53174-7	11/14/13	Soil	Metals, Cr ⁺⁶
ID008 8-8.5	JB53174-8	11/14/13	Soil	Metals, Cr ⁺⁶
FB 09	JB53174-1	11/14/13	Aqueous	Metals, Cr ⁺⁶
FB 10	JB53174-2	11/14/13	Aqueous	Metals, Cr ⁺⁶
FB 11	JB53174-3	11/14/13	Aqueous	Metals, Cr ⁺⁶
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast, Inc. in Orlando, FL. Cr ⁺⁶ – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

Data Review

Data, as presented in the analytical data package SDG JB53174, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgment, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) *“National Functional Guidelines for Inorganic Data Review”*, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006);
- *NJDEP Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data

collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. No sample results exhibited concentrations above the respective site remediation standard (SRS) levels in any of the five soil samples of this SDG, except for two nickel results.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were identified as being outside QC limits in QC Batch MP26428. The case narrative identified the duplicate analysis results being outside QC limits in QC Batch MP26428 for chromium and vanadium, and stated that the differences were possibly due to sample non-homogeneity. However, review of the data indicated that the difference between the vanadium results was less than two times the reporting limit, thereby meeting QC limits. The case narrative also stated that the RPDs for the spiked duplicates were outside control limits. However, these results were below the 35%RPD DV QC limit and, therefore, not subject to qualification. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all inductively coupled plasma argon (ICP) analyzed samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There was one exception where the internal standard area count (IS#2) was above QC limits for JB53174-4.

The exception included the internal standard area counts for IS#2 which is associated with chromium and vanadium in analytical run MA11235 for Sample JB53174-4. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Consequently, the 126.3% result for JB53174-4 was all less than 127% and apparently, therefore, not reanalyzed, as the IS area counts are considered acceptable by the laboratory representatives.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks or the continuing calibration blanks at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53174.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were outside QC limits of 75 - 125% for QC samples in the identified QC batch which are summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential or low bias in the ability to recover the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits in SDG JB53174

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26428 Ω	FA10297-1	Antimony	50.4 %	52.9 %	NJ-	Low
QC Limits are 75-125%; NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. MS – Matrix spike MSD – Matrix spike duplicate. Ω – The samples associated with QC Batch MP26428 consist of JB53174-4 through -8 (inclusive).						

The antimony results in the affected samples are flagged with "NJ-" due to a potential low bias. These qualified results are presented below in summary table, Table 5.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The case narrative identified the duplicate analysis results being outside QC limits in QC Batch MP26428 for chromium and vanadium, and stated that the differences were possibly due to sample non-homogeneity. However, review of the data indicated that the difference between the vanadium results was less than two times the reporting limit, thereby meeting QC limits.

Consequently, only the chromium results associated with MP26428 were subject to qualification following the DV review. All remaining %RPD values were below the QC limits of either 35%RPD or $< 2 \times \text{CRQL}$ for soil samples and, thus, no other results required qualification.

Table 3. Duplicate Analysis Results Outside QC Limits in SDG JB53174

QC Batch	QC Sample	Analyte	Duplicate Difference	DV Qualifier
MP26428 Ω	FA10297-1	Chromium	37.7 %RPD	*J
QC Limit is 35%RPD; *J – The duplicate analysis result is outside QC limits and the reported sample value is estimated with an indeterminate bias direction. Ω – The samples associated with QC Batch MP26428 consist of JB53174-4 through -8 (inclusive).				

Thus, following the DV review, the chromium results associated with QC Batch MP26428 are qualified as estimated values and are to be flagged with “*J” due to the potential variability in the analytical precision as indicated in Table 3, due possibly to sample non-homogeneity, though without exhibiting any clear bias direction. The chromium results appear with “*J” in the summary table, Table 5. Aside from the chromium results in QC Batch MP26428, the remaining duplicate analyses demonstrated acceptable analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 94.4% - 102.4% for the soil sample metals analysis.

Serial Dilution Analysis (QC Limit $\leq 10\%$ D)

The percent difference (%D) results of the serial dilution analysis for SDG JB53174 were all less than the QC limit of 10%D. Thus, no sample results were qualified for serial dilution issues.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported nickel results:

$$\text{Nickel (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times \text{TS}/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The nickel concentration for Sample ID008 0-0.5 (JB53174-4) was listed as 88.2 mg/Kg on the reporting form and 1.599 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Nickel (mg/Kg)} = \frac{(1,599 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.09 \text{ g})(83.2/100\%)} = 88.1954 \mu\text{g/g}$$

$$= 88.2 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the nickel concentration of 88.2 mg/Kg for Sample ID008 0-0.5 was correctly reported.

Reporting Limits

The case narrative did identify that there were various analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of two of the five soil samples that had been diluted by a factor of either two or ten.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards, except where one sample (JB53174-7) was diluted by a factor of 10x, thereby raising the reporting limit for the antimony and thallium results above the respective SRS, as presented below in Table 4, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 4. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result (mg/Kg)	Remediation Standard
ID008 6-6.5	JB53174-7	Antimony	< 1.1	10	< 11 NJ-	6
ID008 6-6.5	JB53174-7	Thallium	< 0.53	10	< 5.3	3

Units – mg/Kg
 < - The analyte was analyzed for, but was not detected above the stated reporting limit.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

The other analyte results associated with the non-detect soil results of antimony and thallium in JB53174-7 were all well below the respective SRS values, including the 0.98 mg/Kg Cr+6 result, thereby suggesting a reasonably “clean” sample.

The interpretation of the antimony (< 11 mg/Kg) and thallium result (<5.3) in JB53174-7 was not significantly compromised by the applied dilution, since the other target analytes in the sample were considerably below their respective SRS values, such that it is likely that the raw amounts of antimony and thallium were similarly not elevated.

Summary

The soil sample analytical results for the samples of SDG JB53174 were found to be compliant with the analytical methods for the analysis of metals in the five soil samples and three field blanks using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries for antimony in the QC batch (MP26428) associated with five soil samples: JB53174-4 through -8. The antimony results in these samples are qualified as estimated values (flagged

“NJ-”) in the associated soil samples due to a potential low bias, as summarized below in Table 5.

The duplicate analysis result for chromium in the QC sample of QC Batch MP26428 was above the QC limit of 35 %RPD, suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the identified chromium results are qualified as estimated values and are flagged with “*J” in five samples, as presented below in Table 5.

Table 5. Summary of Qualified Sample Metals Results in SDG JB53174

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
ID008 0-0.5	JB53174-4	Antimony	< 2.2	NJ-
ID008 0-0.5	JB53174-4	Chromium	69.6	*J
ID008 2-2.5	JB53174-5	Antimony	< 1.0	NJ-
ID008 2-2.5	JB53174-5	Chromium	12.0	*J
ID008 4-4.5	JB53174-6	Antimony	1.5	NJ-
ID008 4-4.5	JB53174-6	Chromium	151	*J
ID008 6-6.5	JB53174-7	Antimony	< 11	NJ-
ID008 6-6.5	JB53174-7	Chromium	29.4	*J
ID008 8-8.5	JB53174-8	Antimony	< 0.97	NJ-
ID008 8-8.5	JB53174-8	Chromium	20.2	*J

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.

NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.

*J – Duplicate analysis not within control limits; the result is an estimated value with indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the soil samples and one QC batch for Field Blank samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in 2 of 5 soil samples analyzed in SDG JB53174. Cr⁺⁶ results were below the SRS of 20 mg/Kg in the three (3) soil samples with detected concentrations.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, and method blanks.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values exceeding 0.9998, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 93.2% to 97.2% for the two QC batches associated with the 5 soil samples and three Field Blank aqueous samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in any of the method blanks (< 0.40 mg/Kg or 0.010 mg/L), any of the continuing calibration blanks (< 0.010 mg/L), or field blanks at the stated reporting limits. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike recovery for insoluble Cr⁺⁶ was within the QC limits of 75-125%, as well as post-spike recoveries that were within the 85-115% QC limits, as presented below in Table 6. However, the soluble matrix spike recovery for Cr⁺⁶ (64.6%) was below the QC limits. Thus, hexavalent chromium results in soil samples associated with the QC batch required qualification based on the result of the MS recovery due to a potential low bias in the ability to recover Cr⁺⁶ in the associated sample matrix.

Table 6. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76207 £	JB53174-7	Cr ⁺⁶ , soluble	64.6 %	NJ-	Low
GP76207 £	JB53174-7	Cr ⁺⁶ , insoluble	81.4 %	----	----
GP76207 £	JB53174-7	Cr ⁺⁶ , post-digestion spike	88.9 %	----	----

QC Limits are 75-125% (soil) for MS recovery; 85-115% for post spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium
£ – The samples associated with QC Batch GP76207 consist of JB53174-4 through -8 (inclusive).

Duplicate Sample Analysis

In soil, the 32.0%RPD result for the duplicate Cr⁺⁶ analyses was the highest result observed in the general chemistry set of duplicate analyses. This %RPD value was above the laboratory QC limit of 20%RPD. However, this %RPD value is acceptable due to low duplicate and sample concentrations. All other duplicate analyses met QC requirements including Cr⁺⁶, redox potential and pH analyses. Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

In the QC batches associated with the soil and aqueous samples, the recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-

120% QC limits, with recoveries ranging 88.2% to 93.3%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in any of the two analytical sequences. Serial dilution analysis is not a requirement of the Cr+6 analytical method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample ID008 4-4.5 (JB53174-6) was listed as 5.7 mg/Kg on the reporting form and 0.1202 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.1202 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00241 \text{ Kg} \times 87.6/100} = \frac{0.01202}{0.00211} = 5.697 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 5.7 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 5.7 mg/Kg for Sample ID008 4-4.5 was correctly reported. This was the highest detected Cr⁺⁶ concentration among the 5 soil samples of this SDG, JB53174. Thus, this detected Cr⁺⁶ concentration result was still below the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

Most samples were observed to fall below the Eh-pH phase diagram line. These results suggest that most of the samples experience conditions of reducing soil environment. One of the five soil samples falls slightly above the Eh-pH phase diagram line. These results suggest that the one soil sample may experience condition of an "oxidizing" soil environment. However,

the reported Cr⁺⁶ results of the affected samples are considered acceptable because of two issues, the Cr⁺⁶ concentration of the samples in the oxidizing environment are below the SRS (20 mg/Kg) and the Cr+6 results of the other samples in the reducing soil are not expected to increase in value because oxidation to Cr⁺⁶ is not favorable under “reducing” soil conditions. Thus, the hexavalent chromium results are considered acceptable as reported, with the highest hexavalent chromium concentration (5.7 mg/Kg) being below the SRS of 20 mg/Kg, as detailed in the text above.

Summary for Hexavalent Chromium Analysis SDG JB53174

Since the MS recovery for the soluble matrix spike was below QC limits, while the other QC results associated with the hexavalent chromium analysis were within the QC limits, the Cr⁺⁶ results of the 5 soil samples of SDG53174 were qualified following the DV review and flagged with “NJ-“. Consequently, the soil samples of the QC batch GP76207 required re-analysis and the resultant data review is presented in the section below labeled “SDG JB53174R”.

SDG JB53174R

Because the soluble MS recovery was below QC limits in the initial analysis of QC batch GP76207, the associated samples required reanalysis where the resultant data for the batch of samples (JB53174-4R through -8R) are summarized in this section.

All QC requirements were met during the reanalysis of samples JB53174-4R through -8R, including calibrations, QC blanks and the matrix spike recoveries. The %RPD for the duplicate analysis of 24.7% was above the laboratory QC limits of 20%. However, this RPD value was considered acceptable due to the low initial sample and duplicate sample concentrations, whose difference was less than the QC limit of “less than two times the CRQL, or reporting limit”.

Matrix Spike Analysis

The following matrix spike recoveries were observed during the reanalysis of the affected samples. However, upon reanalysis, improved MS recoveries were observed, particularly in the soluble spike. The insoluble MS recovery was again within the QC limits of 75-125%, while the post-spike recovery was also within the 85-115% QC limits, as presented below in Table 7.

Table 7. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76536 £	JB53174-7R	Cr ⁺⁶ , soluble	76.4 %	----	----
GP76536 £	JB53174-7R	Cr ⁺⁶ , insoluble	82.2%	----	----
GP76536 £	JB53174-7R	Cr ⁺⁶ , post spike	90 %	----	----
QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery MS – Matrix spike Cr ⁺⁶ – Hexavalent chromium £ – The samples associated with QC Batch GP76536 consist of JB53174-4R through -8R (inclusive).					

Since the soluble and insoluble MS recoveries in QC Batch GP76536 are within the QC limits (75-125%), the Cr⁺⁶ results of the samples of this QC batch are not subject to qualification. No sample results for Cr⁺⁶ had exceeded the SRS value of 20 mg/Kg in the reanalysis.

Summary for Hexavalent Chromium Analysis

The soil sample results from the initial analysis are presented alongside those obtained from the reanalysis of samples in SDG JB53174 below in Table 8. The Cr+6 results of the reanalysis appear to be comparable to those of the initial analysis, whose samples were associated with a low soluble MS recovery in the initial analysis and possibly suggesting a potential low bias in the ability to recover this analyte in the given sample matrix. The MS recoveries in the reanalysis were acceptable, being within QC limits.

Table 8. Comparison of Qualified Sample Cr⁺⁶ Results in SDGs JB53174 and JB53174R

Client ID	Lab Sample ID	Analyte	JB53174 Result (mg/Kg)	DV Qualifier	JB53174R Result (mg/Kg)	DV Qualifier
ID008 0-0.5	JB53174-4	Cr ⁺⁶	< 0.48	NJ-	< 0.48	----
ID008 2-2.5	JB53174-5	Cr ⁺⁶	< 0.44	NJ-	0.55	----
ID008 4-4.5	JB53174-6	Cr ⁺⁶	5.7	NJ-	3.3	----
ID008 6-6.5	JB53174-7	Cr ⁺⁶	0.98	NJ-	0.71	----
ID008 8-8.5	JB53174-8	Cr ⁺⁶	1.2	NJ-	0.51	----
Cr ⁺⁶ – Hexavalent chromium < – The analyte was analyzed for, but not detected at the specified reporting limit. NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is below QC limits; potential low bias.						

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 53174 / JB 53174 R

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times
(for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

Matrix interference for metals analyses.

(2x) JB 53174-4

(10x) JB 53174-9

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

Antimony in JB 53174-7

Thallium in JB 53174-7

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Two nickel results: JB 53174-4, 8.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No analytical procedural problems were noted.

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No

Provide a brief explanation.

Not applicable

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 6 and 7 for details.

*Qualified sample results are presented in
Tables 5 and 8 of the DV report.*

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB53336
Sample Date: November 15, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewers: Faiza M. Botros
Janis V. Giga, Ph.D., REP5554
Report Date: February 20, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-six (26) soil samples and one (1) Field Blank collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 15, 2013 for sample delivery group (SDG) JB53336. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53336 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 26 collected soil samples and 1 Field Blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53336-1 through -26 (inclusive);
- Chromium (EJ) in Samples JB53336-1 through -26 (inclusive);
- Nickel (ENJ-) in Samples JB53336-1 through -11 (inclusive);
- Vanadium (ENJ-) in Samples JB53336-1 through -11 (inclusive);
- Vanadium (EJ) in Samples JB53336-12 through -26 (inclusive);

No other sample results in SDG JB53336 required qualification. Details are provided in the tables and text below. Most of the target metals concentrations were detected below the respective site remediation standard (SRS) limits, while eight (8) nickel, one vanadium and one hexavalent chromium (Cr+6) result exceeded the respective SRS values of 31 mg/Kg, 78 mg/Kg, and 20 mg/Kg.

The individual sample results that were qualified following the DV review are identified in Table 5 of this DV report. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The twenty-six (26) soil and one (1) Field Blank samples collected on November 15, 2013, were received November 15, 2013 at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 3.4°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. preserved and in good condition with on November 19,

2013 with sampling cooler temperatures of 3.4°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Client Sample Designation	Sample Lab ID Number	Date Collected	Matrix	Analyses
FI001 0.5-1	JB53336-1	11/15/13	Soil	Metals, Cr ⁺⁶
FI001 2-2.5	JB53336-2	11/15/13	Soil	Metals, Cr ⁺⁶
FI001 4-4.5	JB53336-3	11/15/13	Soil	Metals, Cr ⁺⁶
FI001 6-6.5	JB53336-4	11/15/13	Soil	Metals, Cr ⁺⁶

Data Review

Data, as presented in the analytical data package SDG JB53336, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgment, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. There were some sample results of the 26 soil samples that exhibited concentrations above the respective site remediation standard (SRS) levels. These included 8 nickel results and one vanadium result.

Laboratory Case Narrative

The case narrative stated that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were identified as being outside QC limits in QC batches MP26429 and MP26431, along with nickel, thallium and vanadium in MP26429. The case narrative identified the serial dilution results being outside QC limits for chromium and vanadium in QC batches MP26429 and MP26431, along with nickel in MP26429. The differences were probably due to sample non-homogeneity and/or matrix interference. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids analysis. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There were four analytical sequences that were used to analyze the soil and QC samples.

The 64% antimony recovery in the closing "CRI" standard of analytical sequence MA11244 recovered slightly below the 70-130% control limits. Thirteen soil samples were associated with this analytical sequence. However, it was observed that the detected concentrations and reporting limits for the non-detect results were all above the "affected range" (true spike \pm CRQL) for each of the associated samples and, consequently, no sample antimony results are subject to qualification (USEPA, 2010).

Additionally, there was one sample whose internal standard (IS#2) area count was above the identified QC limits in analytical sequence MA11240. Internal standard IS#2 is associated with chromium and vanadium. In the analytical sequence MA11240, the area count for IS #2 in JB53336-20 was identified as being outside QC limits on the QC summary report, exceeding the listed QC range of 60-125%. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Review of the data revealed that the area count for IS#2 in this sample was actually within the updated QC limits of 70-130%. Thus, this sample did not warrant reanalysis and the results for chromium and vanadium are considered acceptable. Consequently, the affected sample in MA11240 was not reanalyzed, as the IS area count is considered acceptable by the laboratory.

Thus, no soil sample results were qualified for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53336.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

(QC Limits 75-125% Recovery; ≤ 35%RPD)

The case narrative stated that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were identified as being outside QC limits in QC batches MP26429 and MP26431, along with nickel, thallium, and vanadium in MP26429, of the two identified QC batches which are summarized in Table 2 below. These recoveries indicate possible matrix interference. However, the MS/MSD recoveries for thallium (76.9% and 77.3%) are actually within the QC limits of 75-125% when evaluation data quality (NJDEP, 2002) and are not subject to qualification.

Following the DV review, the sample results subject to qualification for low spike recoveries were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential or low bias in the ability to recover the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits. The MS recovery for chromium in MP26429 below QC limits, but the associated sample results are not subject to qualification because the initial sample concentration was more than four times the spike amount, such that the recovery may have been masked (overwhelmed) by the high chromium concentration in the sample (NJDEP, 2002).

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26429 Ω	FA10038-5	Antimony	18.3 %	18.4 %	NJ-	Low
MP26429 Ω	FA10038-5	Nickel	36.5 %	28.2 %	NJ-	Low
MP26429 Ω	FA10038-5	Vanadium	31.9 %	26.3 %	NJ-	Low
MP26431 †	FA10062-1	Antimony	34.1 %	30.9 %	NJ-	Low

QC Limits are 75-125%;
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate.
 Ω – The samples associated with QC Batch MP26429 consist of JB53336-1 through -11 (inclusive);
 † – The samples associated with QC Batch MP26431 consist of JB53336-12 through -26 (inclusive).

The post-digestion recoveries were outside QC limits for antimony, nickel and vanadium in the respective batches. The post-digestion spikes for antimony were slightly below QC limits in both batches, while the recoveries for nickel and vanadium were above QC limits. Sample results were not additionally qualified for the post-digestion spike recoveries (USEPA, 2010).

The antimony results in all of these affected samples (JB53336-1 through -26) are qualified as estimated values and flagged with "NJ-" due to a potential low bias, while the nickel and vanadium results in soil samples JB53336-1 through -11 (inclusive) are also qualified as estimated values and flagged "ENJ-" in conjunction with the serial dilution results that were above the 10%D QC limit. These qualified results are presented below in summary table, Table 5, together with the sample results qualified for serial dilution analysis results that were also outside QC limits.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on two QC samples analyzed in duplicate. All %RPD values were below the QC limit of 35%RPD, with values ranging 0-9.4%RPD for soil samples and no results required qualification. The duplicate analyses demonstrated very good analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 92.3% - 102.4% for the soil sample metals analysis.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the serial dilution results being outside QC limits for chromium and vanadium in QC batches MP26429 and MP26431, along with nickel in MP26429. The differences were probably due to sample non-homogeneity and/or matrix interference. Thus, the affected chromium, nickel, and vanadium results in the samples associated with the elevated %D exceedances are subject to qualification following the DV review, as indicated in Table 3 below.

Table 3. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26429 Ω	FA10038-5	Chromium	39.3 %D	EJ
MP26429 Ω	FA10038-5	Nickel	41.8 %D	EJ
MP26429 Ω	FA10038-5	Vanadium	37.9 %D	EJ
MP26431 †	FA10062-1	Chromium	14.7 %D	EJ
MP26431 †	FA10062-1	Vanadium	13.6 %D	EJ

Key:
 EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
 Ω – The samples associated with QC Batch MP26429 consist of JB53336-1 through -11 (inclusive);
 † – The samples associated with QC Batch MP26431 consist of JB53336-12 through -26 (inclusive).

The associated chromium, nickel and vanadium results in samples with laboratory sample ID numbers ranging JB53336-1 through -11, inclusive, and chromium and vanadium results with laboratory sample ID numbers JB53336-12 through -26 (inclusive) are qualified as estimated values and flagged with "EJ" to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 5,

along with those results qualified for matrix spike recoveries outside QC limits and flagged with "ENJ-".

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

One set of field duplicate samples was collected as part of SDG JB53336. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2010), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of the one pair of field duplicate samples are presented in Table 4, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples were very similar in this pair of field duplicate samples analyzed and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 29 %RPD or differed by less than two times the reporting limit value (< 2 × CRQL) for all five analyte pairs for the field duplicates from FI003 8-8.5.

Table 4. Comparison of Field Duplicate Soil Sample Results – SDG JB53336

Analyte	FI003 8-8.5 (mg/Kg)	DUP 18 (mg/Kg)	% RPD	DV Flag
Antimony	< 1.1 NJ-	< 2.4 NJ-	< 2 × CRQL	-
Chromium	13.3 EJ	14.7 EJ	10.0 %	-
Nickel	20.9	19.6	6.4 %	-
Thallium	< 0.54	< 1.2	< 2 × CRQL	-
Vanadium	12.2 EJ	16.3 EJ	28.8 %	-
<p>< – The analyte was not detected at the stated reporting limit; J – The reported result is an estimated value; NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low; EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction. CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit; < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.</p>				

Thus, the results for the field duplicate samples from FI003 8-8.5 demonstrated very good sampling representativeness and precision, such that the associated results need not be qualified.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The vanadium concentration for Sample FI002 0.5-1 (JB53336-6) was listed as 78.1 mg/Kg on the reporting form and 1.653 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Vanadium (mg/Kg)} = \frac{(1,653 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.24 \text{ g}) (85.3/100\%)} = \frac{82,650}{1,057.72} = 78.1398 \mu\text{g/g}$$

$$= 78.1 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 78.1 mg/Kg for Sample FI002 0.5-1 was correctly reported.

Reporting Limits

There were 24 of the 26 soil samples that underwent dilution by either a dilution factor of 2x, 4x, or 5x. However, all reporting limits were still below the respective SRS criterion.

Summary

The soil sample analytical results for the samples of SDG JB53336 were found to be compliant with the analytical methods for the analysis of metals in the twenty-six soil samples and one field blank using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries, and differences in the serial dilution analysis, as summarized in Tables 2 and 3. The individual associated sample results are qualified accordingly and listed in Table 5 below. Sample analyte results are flagged with either "NJ-", "EJ", or "ENJ-".

Table 5. Summary Qualified Sample Metals Results in SDG JB53336

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
FI001 0.5-1	JB53336-1	Antimony	< 1.8	NJ-
FI001 0.5-1	JB53336-1	Chromium	21.7	EJ

DD010 8-8.5	JB53336-26	Vanadium	46.5	EJ

Key:

- < –The analyte was analyzed for, but was not detected above the stated reporting limit.
- J – The reported result is an estimated value.
- NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
- E – The serial dilution result is outside control limits; indeterminate bias direction;
- EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one batch for the field blank (aqueous).

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- √ Holding times
- √ Blank Analysis
- √ Calibration standards
- √ Matrix spike recoveries
- √ Duplicate analysis
- √ Laboratory control samples

- √ Calibration verification
- √ Quantitation checks
- √ Data package

- √ Field duplicate sample analysis
- √ Data qualifiers

Hexavalent chromium was detected in 17 of 26 soil samples analyzed in SDG JB53336. Cr⁺⁶ results had exceeded the SRS of 20 mg/Kg in one (1) soil sample.

Case Narrative

The case narrative indicated that the QC requirements were met for issues such as holding time, method blanks, soluble and insoluble blank spike, and matrix spike recoveries. However, the RPD value for the duplicate sample was high due to possible sample non-homogeneity in batch GP76229. Good MS, post spike recovery (101%) on this sample. All other QC requirements were met for the associated samples.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient with values of 0.99990, 0.9997 and 0.9996; values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 90.7% to 100.4% for the three QC batches associated with the 26 soil samples and one (1) Field Blank, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in any of the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L), or field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 6. No hexavalent chromium results required qualification based on the results of the MS recoveries.

Table 6. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76206 ¥	JB53336-13	Cr ⁺⁶ , soluble	97.1 %	----	----
GP76206 ¥	JB53336-13	Cr ⁺⁶ , insoluble	91.0 %	----	----
GP76206 ¥	JB53336-13	Cr ⁺⁶ , post-digestion spike	100 %	----	----
GP76229 §	JB53336-18	Cr ⁺⁶ , soluble	91.3 %	----	----
GP76229 §	JB53336-18	Cr ⁺⁶ , insoluble	91.5 %	----	----
GP76229 §	JB53336-18	Cr ⁺⁶ , post-digestion spike	101 %	----	----
<p>QC Limits are 75-125% (soil) for MS recovery; 85-115% for post spike recovery. MS – Matrix spike Cr⁺⁶ – Hexavalent chromium ¥ – The samples associated with QC Batch GP76206 consist of JB53336-1 through -13 (inclusive); § – The samples associated with QC Batch GP76229 consist of JB53336-14 through -26 (inclusive).</p>					

Duplicate Sample Analysis

The duplicate analysis was performed on two sets of duplicate samples. The %RPD value for the QC batch GP76229 was high (94.5%) due to possible sample non-homogeneity. However, upon inspection of the raw data, it was found that the difference between the two concentrations was less than 2x the reporting limit for Cr+6 in this sample ($1.2 - 0.43 = 0.79$, $< 2 \times 0.45 = 0.90$ mg/Kg). The RPD value for QC batch GP76206 was within the QC limits of 35%RPD for soil samples (USEPA, 2010; AECOM, 2010). Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 90.6% to 94.3%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in any of the three analytical sequences. Although serial dilution analysis is not required by the analytical method, the analyst will, on occasion, perform a serial dilution analysis to provide additional QC information.

Field Duplicate Sample Analysis (QC Limit \leq 50%RPD)

The results for the analysis of the one pair of field duplicate samples are presented in Table 7, below.

Table 7. Comparison of Field Duplicate Soil Sample Results – SDG JB53336

Analyte	FI003 8-8.5 (mg/Kg)	DUP 18 (mg/Kg)	% RPD	DV Flag
Hexavalent Chromium	< 0.54	< 0.53	< 2 × CRQL	-

QC Limit is \leq 50 %RPD or $< 2 \times$ CRQL;
CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;
< 2 × CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.

The results for the hexavalent chromium concentrations in the field duplicate samples from FI003 8-8.5 were almost identical non-detect results and, thus, considered representative, as the concentrations between field duplicate samples differed by less than two times the reporting limit value ($< 2 \times$ CRQL). Excellent sampling representativeness and precision was demonstrated by the pair of field duplicate soil samples from FI003 8-8.5.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample DD010 6-6.5 (JB53336-25) was listed as 24.9 mg/Kg on the reporting form and 0.4863 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.4863 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00250 \text{ Kg} \times 78.0/100} = \frac{0.04863}{0.00195} = 24.94 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 24.9 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 24.9 mg/Kg for Sample DD010 6-6.5 was correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 26 soil samples of this SDG, JB53336. Thus, this detected Cr⁺⁶ concentration result was above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

Most samples were observed to fall below the Eh-pH phase diagram line. These results suggest that many of the samples experience conditions of reducing soil environment. Some of the samples (2 out of 26) fall on or slightly above the Eh-pH phase diagram line. These results suggest that some of the samples may experience condition of an oxidizing soil environment. However, the reported Cr⁺⁶ results of the affected samples are considered acceptable because of two issues, the Cr⁺⁶ concentration of the samples in the oxidizing environment are below the SRS (20 mg/Kg). The Cr+6 results of the other samples in the reducing soil are not expected to increase in value because oxidation to Cr⁺⁶ is not favorable under reducing soil conditions. Thus, the hexavalent chromium results are considered acceptable as reported with the highest hexavalent chromium concentration (24.9 mg/Kg) was above the SRS of 20 mg/Kg, as detailed in the text above.

Summary for Hexavalent Chromium Analysis

The %RPD value in the duplicate sample for the QC batch GP76229 was high (94.5%) due to possible sample non-homogeneity. However, upon checking it was found that the difference between the two concentrations was less than 2x the reporting limit for Cr+6 in this sample. All other QC results associated with the hexavalent chromium analysis were within QC limits.

Consequently, sample results were not affected and no qualification was needed for Cr+6 results in SDG JB53336.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 53336

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? for metals analysis. Yes No
Indicate the identity of the samples and why. Matrix interference

(2x) JB53336 - 1, 6, 7, 11, 13, 15, 17, 19, 21, 22, 23, 24, 26.
 (4x) JB53336 - 5, 12, 16, 18, 25.
 (5x) JB53336 - 2, 3, 4, 8, 9, 10.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Eight nickel results: JB53336 - 6, 14, 19, 22, 23, 24, 25, 26.
 One vanadium result: JB53336 - 6.
 one Cr⁺⁶ result: JB53336 - 25.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.
 No problems with analytical procedures were noted.

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*

10. Were rejected data used?..... Yes No

- If "yes", please indicate reasons rejected data were used:
- For Hex Chrome, data were rejected because spike recovery was <50%.
 - Data were rejected due to missing deliverables.
 - Data were rejected but an applicable standard exceedance exists.
 - Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 - Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

*Refer to DV report Tables 2 and 3 for details.
Qualified sample results are presented in
Table 5 of the DV report.*

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs B53451/JB53451R/JB53451RT
Sample Date: November 18, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis Giga, Ph.D., REP5554
Report Date: February 17, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-one (21) soil samples and one (1) field blank (FB) collected at the PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 18, 2013 for sample delivery group (SDG) JB53451. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53451 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 21 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53451-1 through -21 (inclusive);
- Chromium (NJ+) in Samples JB53451-1 through -9 (inclusive);
- Chromium (EJ) in Samples JB53451-10 through -21 (inclusive);
- Nickel (EJ) in Samples JB53451-10 through -21 (inclusive);
- Vanadium (NJ+) in Samples JB53451-1 through -9 (inclusive);
- Vanadium (ENJ-) in Samples JB53451-10 through -21 (inclusive);
- Nickel and Cr^{+6} (J) in field duplicate samples JB53451-12 and JB53451-16;
- Hexavalent chromium (NJ-) in Samples JB53451-12 through -21 (inclusive);
- Hexavalent chromium (NJ-) in reanalyzed samples JB53451-12R through -21R (inclusive).

No other sample results in SDG JB53451 required qualification. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for 9 hexavalent chromium (Cr⁺⁶) results, one antimony result; and one nickel and vanadium result in JB53451-1. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

The sample results that were qualified following the DV review are presented in Tables 5 and 9 of this DV report.

Sample Receipt

The twenty-one (21) soil samples and one (1) field blank collected November 18, 2013 were received the same day at the Accutest laboratory with acceptable sampling cooler temperatures of 2.6°C. The samples destined for metals analysis were received at the Accutest Laboratory SE in Orlando, Florida November 20, 2013 preserved and intact with sampling cooler temperatures of 2.6°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
KD006 5.5-6	JB53451-1	11/18/13	Soil	Metals, Cr+6
KD006 6.5-7	JB53451-2	11/18/13	Soil	Metals, Cr+6
KD006 7.5-8	JB53451-3	11/18/13	Soil	Metals, Cr+6
KD006 8.5-9	JB53451-4	11/18/13	Soil	Metals, Cr+6
KD006 9.5-10	JB53451-5	11/18/13	Soil	Metals, Cr+6
LD005 5.5-6	JB53451-6	11/18/13	Soil	Metals, Cr+6
LD005 6.5-7	JB53451-7	11/18/13	Soil	Metals, Cr+6
LD005 7.5-8	JB53451-8	11/18/13	Soil	Metals, Cr+6
LD005 8.5-9	JB53451-9	11/18/13	Soil	Metals, Cr+6
LD005 9.5-10	JB53451-10	11/18/13	Soil	Metals, Cr+6
LD004 5-5.5	JB53451-11	11/18/13	Soil	Metals, Cr+6
LD004 6-6.5	JB53451-12	11/18/13	Soil	Metals, Cr+6
LD004 7-7.5	JB53451-13	11/18/13	Soil	Metals, Cr+6
LD004 8-8.5	JB53451-14	11/18/13	Soil	Metals, Cr+6
LD004 9-9.5	JB53451-15	11/18/13	Soil	Metals, Cr+6
DUP 19	JB53451-16	11/18/13	Soil	Metals, Cr+6
LD003 4.5-5	JB53451-17	11/18/13	Soil	Metals, Cr+6
LD003 5.5-6	JB53451-18	11/18/13	Soil	Metals, Cr+6
LD003 6.5-7	JB53451-19	11/18/13	Soil	Metals, Cr+6
LD003 7.5-8	JB53451-20	11/18/13	Soil	Metals, Cr+6
LD003 8.5-9	JB53451-21	11/18/13	Soil	Metals, Cr+6
FB 13	JB53451-22	11/18/13	Aqueous	Metals, Cr+6

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories SE in Orlando, FL.
 Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB53451, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) "*National Functional Guidelines for Inorganic Data Review*", OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Two of the 21 soil samples exhibited metals concentrations above the respective site remediation standard (SRS) where antimony exceeded the SRS of 6 mg/Kg in JB53451-13, and nickel and vanadium in JB53451-1 were above the respective SRS values of 6 and 31 mg/Kg.

Laboratory Case Narrative

The extensive case narrative identified all analytes for the samples that were diluted, listing them individually by analyte. Matrix spike (MS) recoveries for antimony, chromium and vanadium were identified as being outside QC limits in QC Batch MP26432 along with the matrix spike duplicate (MSD) recoveries of antimony and chromium due to matrix interferences and/or sample non-homogeneity. Antimony was outside QC limits for the MS/MSD recoveries in MP26439, along with the MSD recovery of vanadium. The case narrative identified the serial dilution results being outside QC limits in QC Batch MP26439 for chromium, nickel, and vanadium and stated that the probable cause is due to sample non-homogeneity and/or matrix interference. Non-client samples served as the QC sample in each batch. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids. Details are discussed in the sections below. The metals analyses were performed at the Accutest Laboratories Southeast in Orlando, Florida.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the internal standard area counts identified below for analytical sequence MA11238, and the low closing CRDL standard recovery for antimony in analytical sequence MA11244.

The exceptions included the internal standard area counts for IS#2 which is associated with chromium and vanadium in analytical run MA11238. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Consequently, the three affected samples in MA11238, JB53451-2 (126%), JB53451-5 (127%), and JB53451-7 (125%) were all less than 127% and apparently, therefore, not reanalyzed, as the IS area counts are considered acceptable by the laboratory representatives.

The closing CRDL standard (CRIA2) recovered on 64% for antimony, a value below the QC limits of 70-130%. The 64% antimony recovery in the closing "CRI" standard of analytical sequence MA11244 recovered slightly below the 70-130% control limits. Eight soil samples were associated with this analytical sequence. However, it was observed that the detected concentrations and reporting limits for the non-detect results (approximately 1 mg/Kg) were all above the "affected range" (true spike \pm CRQL) of approximately 0-0.6 mg/Kg for each of the associated samples and, consequently, no sample antimony results are subject to qualification (USEPA, 2010). Additionally, the analysis of a CRDL standard is not addressed in either Method 6010C or the associated DV guidelines (NJDEP, 2002).

No soil sample results warranted qualification for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53451.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony in QC batches for soil samples were below QC limits, as summarized in Table 2 below. The MS/MSD recoveries for chromium and the MS recovery for vanadium were above QC limits of 75 - 125% for the non-client QC sample in QC Batch MP26432, while the MSD recovery for vanadium in QC Batch MP26439 was below the QC limits, as summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. None of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits. Following the DV review, the sample results subject to qualification for spike recoveries outside QC limits were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with either "J+" or "J-" to indicate the possible presence of a possible high or low bias in the ability to recovery the particular analyte in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26432 Ω	FA10098-1	Antimony	20.3 %	18.0 %	NJ-	Low
MP26432 Ω	FA10098-1	Chromium	137.6 %	131.7 %	NJ+	High
MP26432 Ω	FA10098-1	Vanadium	131.4 %	80.4 %	NJ+	High
MP26439 †	FA10289-1	Antimony	27.1%	29.9 %	NJ-	Low
MP26439 †	FA10289-1	Vanadium	80.8 %	67.8 %	NJ-	Low
QC Limits are 75-125%; Post-digestion spike QC is 80-120% NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. NJ+ – The matrix spike recovery was below QC limits; associated sample results may experience a potential high bias. MS – Matrix spike MSD – Matrix spike duplicate Ω – The samples associated with QC Batch MP26432 consist of JB53451-1 through -9 (inclusive); † – The samples associated with QC Batch MP26439 consist of JB53451-10 through -21 (inclusive).						

The spike recoveries for chromium were observed to be biased high, however, the chromium concentration in the initial QC sample (FA10098-1) was almost four times the spike amount and some masking of the spike might have been responsible for the elevated MS/MSD recoveries. The chromium results in the associated samples were qualified as estimated values and flagged with "NJ+" due to a potential positive bias in the ability to recover chromium in the associated samples, which included those with laboratory sample ID numbers JB53451-1 through -9. The vanadium results for these samples are also flagged with "NJ+", while the antimony results in these samples and those of JB53451-1 through -21 are flagged with "NJ-" due to a potential low bias. The vanadium results are also flagged with "NJ-" in the second set of samples. These qualified results are presented below in summary table, Table 5 together with the results qualified for serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate soil sample analysis was performed on two QC samples and on two pairs of spiked duplicate samples. All %RPD values were below the QC limit of 35%RPD for soil samples and no

results required qualification. The RPD values for the soils samples analysis ranged 0 to 7.0 %RPD for the duplicate analyses and 3.3 to 19.6%RPD for the spiked duplicate analysis. The duplicate and spike duplicate results in the QC batch associated with the field blank were also within the 20%RPD QC limits for aqueous samples. Therefore, the duplicate analyses demonstrated very good analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 96.8% - 106.2%.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the serial dilution results being outside QC limits in QC Batch MP26439 for chromium, nickel, and vanadium and stated that the probable cause is due to sample non-homogeneity and/or matrix interference. These are detailed in Table 3 below.

Table 3. Serial Dilution Results Outside QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26439 †	FA10289-1	Chromium	24.7 %	EJ
MP26439 †	FA10289-1	Nickel	23.8 %	EJ
MP26439 †	FA10289-1	Vanadium	23.0 %	EJ
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.				
† – The samples associated with QC Batch MP26439 consist of JB53451-10 through -21 (inclusive).				

The associated chromium, nickel, and vanadium results in samples with laboratory sample ID numbers ranging JB53451-10 through -21, inclusive, are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 5, along with those results qualified for low matrix spike recoveries.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

One set of field duplicate samples was collected as part of SDG JB53451. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying results from the USEPA CLP program for soil samples analyzed by ICP-AES using the CLP Statement of Work (SOW) ISM01.X (but not Method 6010C) that differ by more than 50%RPD or > 2 × CRQL (USEPA, 2010; AECOM, 2010).

The results for the analysis of the one pair of field duplicate samples are presented in Table 4, below. It is evident that the results for the metals analytes that were detected in the field duplicate samples were very similar and, thus, considered representative, as the concentrations between field duplicate samples differed by less than 30 %RPD or differed by less than two times the reporting limit value (< 2 × CRQL) for all analyte pairs, except for the 66%RPD for nickel, thereby meeting the QC limits for field duplicate samples for all but one parameter.

Table 4. Comparison of Field Duplicate Soil Sample Results – SDG JB53451

Analyte	LD004 6-6.5 (mg/Kg)	DUP 19 (mg/Kg)	% RPD	DV Flag
Antimony	< 0.85 NJ-	< 4.2 NJ-	< 2 × CRQL	-
Chromium	208 EJ	256 EJ	20.7 %	-
Nickel	28.8 EJ	14.5 EJ	66.0 %	(J)
Thallium	< 0.43	< 2.1	< 2 × CRQL	-
Vanadium	43.6 ENJ-	32.4 ENJ-	29.5 %	-

< – The analyte was not detected at the stated reporting limit.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
 EJ – The reported value is estimated because of the presence of interference with indeterminate bias direction.
 (J) – Sample result is subject to DV qualification, but not additionally flagged with “J” to avoid redundancy.
 CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit.
 < 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

This pair of field duplicate samples demonstrated acceptable sampling representativeness and precision for the five target metals analyzed. The only results subject to qualification were the nickel results LD004 6-6.5 and DUP 19. However, since these nickel results are qualified for the disparity in the serial dilution analysis and may exhibit a potential variability due to possible matrix interferences, the results were not flagged with an additional “J” flag in order to avoid redundancy in qualifiers.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported antimony results:

$$\text{Antimony (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The antimony concentration for Sample LD004 5-5.5 (JB53451-13) was listed as 7.3 mg/Kg on the reporting form and 0.146 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Antimony (mg/Kg)} = \frac{(146 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.20 \text{ g}) (82.9\%/100\%)}$$

$$= 7.3 \text{ mg/Kg dry weight}$$

After rounding to two significant figures, this verifies that the antimony concentration of 7.3 mg/Kg for Sample LD004 5-5.5 was correctly reported. This value is above the SRS of 6 mg/Kg. Antimony was detected in two other samples at concentrations of 1.9 mg/Kg or less.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of twelve of the 21 soil samples had been diluted by a factor of either two, four or five. The reporting limits for the target analytes determined for the inductively coupled argon plasma spectrometer (ICP) analysis employing the various assigned laboratory instruments all were below the respective site remediation standards.

Summary

The soil sample analytical results for the samples of SDG JB53451 were found to be compliant with the analytical methods for the analysis of metals in the twenty-one soil samples using SW-846 Method 6010C. The QC criteria were met for all ICP target analyte analyses, except for the low MS/MSD recoveries for antimony in both soil sample QC batches which employed a non-client soil sample for the QC analyses. Sample results were qualified based on the results of the non-client QC samples because the sample concentrations were not unlike those observed in PPG soil samples. Chromium and vanadium experienced elevated matrix spike recoveries in the the QC batch associated with samples JB53451-1 through -9, while vanadium experienced a low MSD recovery in the second QC batch. The soil samples collected November 18, 2013 are qualified as estimated values for antimony, chromium, and vanadium (flagged "NJ-" or "NJ+") in the associated soil samples due to a potential low or high bias, as indicated below in Table 5. The serial dilution results were outside QC limits suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the chromium, nickel and vanadium results are qualified as estimated values and are flagged with "EJ" in Table 5 below for samples numbered JB53451-10 through -21 (inclusive).

Table 5. Summary of Qualified Sample Metals Results in SDG JB53451

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
KD006 5.5-6	JB53451-1	Antimony	< 5.1	NJ-
KD006 5.5-6	JB53451-1	Chromium	1270	NJ+

Key:

- < – The analyte was analyzed for, but was not detected above the stated reporting limit.
- N – The matrix spike sample recovery in the associated QC sample is not within QC limits.
- J – Indicates an estimated value.
- J+ – The result is an estimated value, but the result may be biased high.
- J- – The result is an estimated value, but the result may be biased low.
- E – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr+6) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one QC batch for the single field blank.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|---------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Field Duplicate Sample analysis |
| √ Data package completeness | √ Serial dilution analysis |
| √ Data qualifiers | √ Quantitation checks |

Hexavalent chromium was detected in nineteen of the 21 soil samples, with nine concentrations exceeding the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that the QC requirements were met, including the holding time, method blanks, and matrix spike recoveries, except for the low MS recoveries in QC Batch GP76299. The RPD(s) for the Duplicate in QC Batch GP76299 was outside QC limits, but the RPD was acceptable due to low duplicate and sample concentrations. The soluble MS recovery in QC Batch GP76275 was outside QC limits but the soluble spike amount was low relative to the sample amount.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values all exceeding 0.99982 values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 98.1% to 101.5% for the two QC batches associated with the 21 soil samples, and 100.2% for the QC batch associated with the field blank sample, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L), or the field blanks. Thus, no sample results are affected or qualified for any potential QC blank contamination. Hexavalent chromium was not detected in the field blanks at a reporting limit of 0.010 mg/L.

Matrix Spike Analysis

The matrix spike recoveries were within the QC limits of 75-125%, except for the soluble MS recovery for JB53451-14 in QC Batch GP76299. The soluble MS recovery in QC Batch GP76275 was 134.5%, a value above the QC limits. However, since the initial Cr+6 concentration in JB53451-1 was more than four times the spike value, the associated sample results were not subject to qualification, because the low spike amount may have been masked by the sample amount, thereby potentially affecting the spike recovery (NJDEP, 2005).

The 1.9% soluble matrix spike recovery for hexavalent chromium was below the QC limits of 75-125% for batch QC Sample JB53451-14 in QC Batch GP76299, which indicates possible matrix interference. All other matrix spike recoveries were within the respective QC limits, as summarized below in Table 6.

Table 6. Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76275 £	JB53451-1	Cr+6, soluble	134.5 %	----	----
GP76275 £	JB53451-1	Cr+6, insoluble	82.7 %	----	----
GP76275 £	JB53451-1	Cr+6, post spike	92.0 %	----	----
GP76299 §	JB53451-14	Cr+6, soluble	1.9 %	NJ-	Low
GP76299 §	JB53451-14	Cr+6, insoluble	80.0 %	---	----
GP76299 §	JB53451-14	Cr+6, post spike	50.6 %	NJ-	Low

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike.
 £ – The samples associated with QC Batch GP75798 consist of JB51750-2 through -5, JB51750-7, JB51750-10 through -14 (inclusive).
 § – The samples associated with QC Batch GP75802 consist of JB51750-16 through -22, JB51750-22 through -25, JB51750-27, and JB51750-28.
 Ø – The samples associated with QC Batch GN94224 consist of field blanks JB51750-29 and -30.

The soluble MS recovery of 1.9% was below QC limits for Cr+6 for the spiked sample from sampling location LD004 8-8.5 in the soil sample analysis in QC Batch GP76299 which was associated with 10 soil samples with lab sample IDs of JB53451-12 through -21 (inclusive). Despite the 1.9% soluble MS recovery, the results were not rejected, because the insoluble MS recovery was within QC limits, an approach found acceptable by Mr. Joseph Sanguiliano of the NJDEP.

Applying the DV guidelines that are based on SW-846 Method 7196A (NJDEP, 2005), the hexavalent chromium results for the associated ten soil samples are, consequently, qualified as estimated values and flagged with "NJ-" due to the potential low bias in the ability to recover this analyte in the soil matrix. These qualified results are presented below in Table 9.

Duplicate Sample Analysis

All duplicate analyses met QC requirements with values less than 3.0 %RPD, including Cr+6, redox potential and pH analyses, except for the 73.2%RPD for the duplicate analysis associated with samples JB53451-12 through -21. Although the 73.2%RPD for Cr+6 was above the laboratory QC limit for the duplicate analysis of sample JB53451-14 in GP76299, the value is acceptable because of the low sample concentrations which differ by less than the DV QC guideline of $\leq 2 \times \text{CRQL}$ (USEPA, 2010; USEPA, 2006) when sample concentrations are low ($< 5 \times \text{RL}$). Consequently, no sample results associated with this SDG, SDG JB53451, are subject to qualification for analytical precision issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries between 97.5% and 100.1% for the soil sample analyses, and 93.3% for the analysis associated with the field blank, thereby demonstrating acceptable analytical system performance.

Field Duplicate Analysis

The results for the analysis of one pair of field duplicate samples are presented in Table 7, below. It is evident that the results of the detected results of sample LD004 6-6.5 and its field duplicate differed by more than the QC limit of 50%RPD.

Table 7. Comparison of Field Duplicate Soil Sample Results – SDG JB53451

Analyte	LD004 6-6.5 (mg/Kg)	DUP 19 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	23.8 NJ-	58.3 NJ-	84.0 %	(J)
<p>< – The analyte was not detected at the stated reporting limit NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is not within QC limits; possible low bias. (J) – Sample result is subject to DV qualification, but not additionally flagged with "J" to avoid redundancy; CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit. $< 2 \times \text{CRQL}$ – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.</p>				

The difference between the field duplicate samples from LD004 6-6.5 was greater than the QC limit of 50%RPD (AECOM, 2010). Thus, the two results are subject to qualification. However, since the two results from LD004 6-6.5 and DUP 19 are already qualified as estimated values for the low MS recovery, no additional "J" flag was applied in order to avoid redundancy of qualifiers. No sample results need be additionally qualified for field duplicate sample results disparities.

Serial Dilution Analysis

No serial dilution analysis was performed in either of the two QC batches associated with the soil samples in this SDG. This is not a required analysis of the method.

Sample Result Verification

Sample Cr+6 concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr+6 results:

$$\text{Cr+6 (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calibration curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample KD006 5.5-6 (JB53451-1) was listed as 590 mg/Kg on the reporting form and 0.5404 mg/L on the quantitation report in the raw data for a 25-fold dilution analysis. A calculation check provides the following result:

$$\text{Cr+6 (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr+6 (mg/Kg)} = \frac{0.5404 \text{ mg/L} \times 0.1 \text{ L} \times 25}{0.00245 \text{ Kg} \times 93.4/100} = \frac{1.351}{0.0022883} = 590.3946 \text{ mg/Kg}$$

$$\text{Cr+6 (mg/Kg)} = 590 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 590 mg/Kg for Sample KD006 5.5-6 was correctly reported. This was the highest detected Cr+6 concentration detected among the 21 soil samples of this SDG, JB53451, analyzed for hexavalent chromium. This was one of nine detected Cr+6 concentration results above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No other disparities relative to the reported values and characteristics were observed. All results met the QC limits, such that no pH or redox potential (ORP) results are subject to qualification.

All but four of the 21 soil samples fell below the Eh-pH phase diagram line. These results suggest that almost all of the samples experience conditions of a "reducing" soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. Of the four samples experiencing oxidizing conditions, the highest detected Cr+6 concentration was 590 mg/Kg in JB53451-1; the total chromium result from its ICP analysis was 1270 mg/Kg. Of the three remaining sample Cr+6 results above the Eh-pH line, samples JB53451-5 (27.5 mg/Kg Cr+6) and JB53451-18 (20.2 mg/Kg Cr+6) were above the SRS with corresponding total chromium values of 68.4 and 147 mg/Kg Cr, respectively. The fourth result above the Eh-pH line was JB53451-6 whose Cr+6 and total Cr results were 7.3 mg/Kg Cr+6 and 26.4 mg/Kg Cr.

Consequently, the three results above the SRS are expected to be remediated, while the fourth result appears to have an insufficient chromium concentration to oxidize to Cr+6 above the SRS.

Summary of Cr+6 Results in SDG JB53451

Due to the low MS recovery for the soluble spike in QC Batch GP76299, the Cr+6 results in the associated 10 soil samples are qualified as estimated values and flagged with "NJ-" due to a low soluble MS recovery. No other Cr+6 results were subject to qualification in the hexavalent chromium analyses, or the results of the pH, redox potential or total solids analyses. The Cr+6 results qualified due to low Cr+6 spike recoveries in the soluble MS analysis following the DV review are presented in Table 9 near the end of this DV report and compared to results from their reanalysis.

Because the soluble MS recovery was below QC limits in QC Batch GP76299, the samples required reanalysis where the resultant data are presented in SDG JB53451R and summarized in this report in sections below under the subsection labeled "SDG JB53451R".

SDG JB53451R

Because the soluble MS recoveries in the initial soil sample analysis for hexavalent chromium were below the QC limit of 75% for the spike recoveries associated with the ten (10) soil samples, and the post-spike recoveries were below the 85-115% QC limits, these 10 soil samples of SDG JB53451 were reanalyzed for hexavalent chromium. The soil samples numbered JB53451-12 through -21 were re-analyzed and the data submitted in a supplemental data package labeled JB53451R (R for reanalysis). The samples were re-prepped on December 9 and reanalyzed December 13, 2013 for Cr+6, within the 30-holding time for soil samples. The samples present in SDG JB53451R are identified in Table 1, but are labeled with the suffix 'R' in the laboratory sample ID number such as JB53451-12R for the reanalysis of client ID sample LD004 6-6.5, which was the sample used as the QC sample in SDG JB53451R. Hexavalent chromium was detected in six of the 10 reanalyzed soil samples, with three concentrations of 33.7, 22.1 and 24.5 mg/Kg above the SRS of 20 mg/Kg, with the remaining three detected results less than 19.5 mg/Kg.

The case narrative of SDG JB53451R indicated that the QC requirements were met for the reanalysis of the soil samples of SDG JB53451R, except that the four MS recoveries were outside QC limits, as presented in Table 8 below for JB53451-12R MS. This QC sample was associated with the 10 soil samples with laboratory ID numbers JB53451-12R through -21R.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient with the value of 0.99992 a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 98.0% to 101.2% for the QC batch associated with the ten soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blank (< 0.40 mg/Kg), or any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike (MS) recovery for the soluble matrix spike was below QC limits in the re-analysis of JB53451-12R from soil sampling location LD004 6-6.5. Thus, the hexavalent chromium results for samples with laboratory sample ID numbers JB53451-12R through -21R are still subject to qualification to be flagged with "NJ-".

Table 8. Matrix Spike Recovery Results in SDG JB53451R

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76537	JB53451-12R	Cr+6, soluble	27.4 %	NJ-	Low
GP76537	JB53451-12R	Cr+6, insoluble	73.9 %	NJ-	Low
GP76537	JB53451-12R	Cr+6, post spike	69.5 %	NJ-	Low
GP76537	JB53451-12R	Cr+6, pH-adjusted post spike	76.5 %	NJ-	Low
QC Limits are 75-125% for MS Recovery; 85-115% for post spike recovery. NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. MS – Matrix spike					

These qualified Cr+6 results from the reanalysis are presented alongside those of the initial analysis in Table 9. The Cr+6 results from the re-analysis are reasonably comparable to those results obtained in the initial analysis, with perhaps the results for DUP 19 affected by soil sample non-homogeneity.

Duplicate Sample Analysis

Sample JB53451-14R was analyzed in duplicate. The difference between the duplicate samples was an excellent value of 0.0 %RPD, because the concentrations were both non-detect results. Since the difference of 0%RPD was below the laboratory QC limit of 20%RPD and the 35% DV QC criterion, acceptable analytical precision was demonstrated.

The difference between Cr+6 concentrations of field duplicate samples from LD004 6-6.5 was 41.6%RPD, a value below the 50%RPD QC limit (AECOM, 2010; USEPA, 2010), thereby demonstrating acceptable sampling representativeness and precision.

Laboratory Control Sample (LCS) Analysis

The LCS recoveries were acceptable and within QC limits of 80-120%, with recoveries of ranging from 88.4% and 99.0%, thereby demonstrating acceptable analytical system performance.

Sample Result Verification

The detected hexavalent chromium concentration for Sample LD003 5.5-6 (JB53451-18R) was listed as 19.5 mg/Kg on the reporting form and 0.4516 mg/L on the quantitation report in the raw data. This is a concentration approaching the SRS of 20 mg/Kg. A calculation check provides the following result:

$$\text{Cr+6 (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr+6 (mg/Kg)} = \frac{0.4516 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00254 \text{ Kg} \times 91.2/100} = \frac{0.04516}{0.0023165} = 19.4951 \text{ mg/Kg}$$

Cr+6 (mg/Kg) = 19.5 mg/Kg

After rounding to 3 significant figures, this verifies that the hexavalent chromium concentration of 19.5 mg/Kg for Sample LD003 5.5-6 was correctly reported.

SDG JB53451RT

The reducing conditions in the soil matrix appear supported by the TOC, S⁻ screen and Fe⁺² data.

The supporting analyses (ferrous iron, sulfide screen, and TOC) were analyzed on Sample JB53451-14 (LD004 8-8.5), a sample which was analyzed twice without detecting a positive concentration of Cr+6 above 0.51 mg/Kg. The three supporting parameters were analyzed outside the respective holding times in order to provide more information about the possible impact of the sample matrix on the Cr+6 recoveries.

The detected ferrous iron (1.5%) and TOC concentration (23,000 mg/Kg) results in JB53451-14RT are at comparable levels with samples in the research literature identified as exhibiting “reducing” soil conditions (Brose and James, 2013; Jardine, et al., 1999), as also indicated on the Eh-pH phase diagram. Thus, the results of the supplemental analyses support the soil conditions being of a “reducing” environment. The “reducing” conditions in the soil matrix of a soil sample falling below the Eh-pH phase line are thereby supported by the TOC, Fe⁺² and Eh-pH data.

Summary for Hexavalent Chromium Analysis

The soil sample results from the initial analysis are presented alongside those obtained from the reanalysis of samples in SDG JB53451 below in Table 9. The Cr+6 results of the reanalysis appear to be comparable to those from the of the initial analysis, both associated with low MS recoveries and possibly suggesting a potential low bias in the ability to recover this analyte in the given sample matrix.

Table 9. Comparison of JB53451 Sample Cr+6 Results Qualified For Low MS Recoveries

Client ID	Lab Sample ID	Analyte	JB53451 Result (mg/Kg)	DV Qualifier	JB53451R Result (mg/Kg)	DV Qualifier
LD004 6-6.5	JB53451-12	Cr+6	23.8	NJ-	33.7	NJ-
LD004 7-7.5	JB53451-13	Cr+6	4.4	NJ-	13.8	NJ-
LD004 8-8.5	JB53451-14	Cr+6	0.56	NJ-	< 0.50	NJ-

DUP 19	JB53451-16	Cr+6	58.3	NJ-	22.1	NJ-
LD003 4.5-5	JB53451-17	Cr+6	27.4	NJ-	24.5	NJ-
LD003 5.5-6	JB53451-18	Cr+6	20.2	NJ-	19.5	NJ-
LD003 6.5-7	JB53451-19	Cr+6	0.45	NJ-	< 0.45	NJ-
LD003 7.5-8	JB53451-20	Cr+6	0.85	NJ-	< 0.49	NJ-
LD003 8.5-9	JB53451-21	Cr+6	< 0.49	NJ-	0.51	NJ-

NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is below QC limits; possible low bias.
 < – The analyte was analyzed for, but not detected at the specified reporting limit.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	Results are estimated and the data are valid for limited purposes. The results are qualitatively acceptable.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference.

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 53451

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No

Indicate the identity of the samples and why. *Matrix interference for metals analysis and high Cr⁺⁶ concentrations above calibration range.*

(2x) JB 53451 - 4, 10, 14, 15, 19. Cr⁺⁶: (25x) JB 53451 - 1.

(4x) JB 53451 - 3, 6, 11, 13, 16. (10x) JB 53451 - 2, 3,

(5x) JB 53451 - 1, 17. (2x) JB 53451 - 16.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

One antimony: JB 53451-13

one nickel and vanadium: JB 53451-1

Nine Cr⁺⁶ results: JB 53451-1, 2, 3, 5, 11, 12, 16, 17, 18.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No problems with analytical procedure were noted.

JB 53451

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No

Provide a brief explanation.

Not applicable

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, 6, 7, and 8 for details.

Qualified sample results are presented in tables 5 and 9 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB53603/JB53603R/JB53603RT/
and JB53603T

Sample Date: November 18 and 19, 2013

Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97

Reviewer: Janis V. Giga. Ph.D., REP5554

Report Date: February 19, 2014

This data validation (DV) report presents the data review and result qualifications for twenty-eight (28) soil samples and one (1) field blank (FB) collected at the PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 18-19, 2013 for sample delivery group (SDG) JB53603. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast, Inc. in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53603 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 28 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53603-1 through -6 (inclusive), JB53603-8 through -11, JB53603-13 through -18 (inclusive), and JB53603-20 through -25 (inclusive);
- Antimony (*ENJ-) in Samples JB53603-7, and JB53603-26 through -29;
- Antimony (*NJ-) in Sample JB53603-12;
- Antimony (NJ-) in the reanalyzed of Sample JB53603-29T;

- Chromium, nickel and vanadium (EJ) in Samples JB53603-1, -3, and -4;
- Chromium (NJ+) in Samples JB53603-2, -5, -6, JB53603-8 through -11, JB53603-13 through -18, and JB53603-20 through -25 (inclusive);
- Chromium (*EJ) in Samples JB53603-7, -12, and JB53603-26 through 29 (inclusive);

- Nickel (*NJ) in Samples JB53603-7, and JB53603-26 through 29 (inclusive);
- Nickel (*ENJ+) in Sample JB53603-12;
-
- Vanadium (*J) in Samples JB53603-7, and JB53603-26 through 29 (inclusive);
- Vanadium (*ENJ+) in Sample JB53603-12;

- Hexavalent chromium (NJ-) in Samples JB53603-1 through -5 (inclusive), JB53603-20 through -29 (inclusive);
- Hexavalent chromium (*NJ-) in Samples JB53603-6 through -18 (inclusive);
- Hexavalent chromium (NJ-) in reanalyzed samples JB53603-1R through -5R (inclusive), and JB53603-20R through -29R (inclusive);
- Hexavalent chromium (J) in field duplicate samples JB53603-14R and JB53603-18R;

No other sample results in SDG JB53603 required qualification. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for 9 hexavalent chromium (Cr+6) results, eight nickel results, four vanadium and one antimony result. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

The sample results that were subject to qualification following the DV review are presented in Tables 7, 12, and 14 of this DV report.

Sample Receipt

The twenty-eight (28) soil samples and one (1) field blank collected November 18-19, 2013 were received at the Accutest laboratory on November 19, 2013 with acceptable sampling cooler temperatures of 3.2°C. The samples destined for metals analysis were received at the Accutest Laboratory SE in Orlando, Florida November 21, 2013 preserved and intact with sampling cooler temperatures of 2.6°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories SE in Orlando, FL. Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

Data Review

Data, as presented in the analytical data package SDG JB53603, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) *“National Functional Guidelines for Inorganic Data Review”*, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Field duplicate sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Several sample results exhibited concentrations above the respective site remediation standard (SRS) in some of the 28 soil samples of this SDG. These included eight nickel results that exceeded the SRS of 31 mg/Kg, four vanadium results above 78 mg/Kg, and one antimony result above its SRS of 6 mg/Kg.

Laboratory Case Narrative

The extensive case narrative identified all analytes for the samples that were diluted, listing them individually by analyte in random fashion. Matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were identified as being outside QC limits in QC Batch MP26450. The case narrative stated that the RPDs for antimony, nickel and thallium between the spiked duplicates were outside QC limits in this QC batch; however, the values were below the data quality QC limit of 35%RPD for soil samples. The serial dilution results in this SDG were outside QC limits for chromium, nickel and vanadium and probably due to sample non-homogeneity. In separate statements, the case narrative stated that these differences indicate possible matrix interference.

In QC Batch MP26451, the MS recoveries for antimony and vanadium were outside QC limits, while the MSD recoveries for antimony and chromium were outside QC limits, indicating possible matrix interference. However, the MS recovery for vanadium was actually within the DV QC limits of 75-125%, thereby indicating an acceptable spike recovery.

The MS/MSD recoveries for antimony and nickel were outside QC limit, as were the chromium and vanadium recoveries in QC Batch MP26455. However, because the sample concentrations of chromium and vanadium were more than four times the spike amount, the chromium and vanadium results are not subject to qualification. There were large differences between the recovered spike concentrations for antimony, chromium, nickel, and vanadium. The case narrative stated that the RPD(s) for antimony and chromium in the serial dilution analysis were outside QC limits, but that the percent difference values were acceptable due to low initial sample concentration (< 50 times IDL). However, this statement is not correct, since both the antimony and chromium initial concentrations were clearly greater than 50 times the IDL.

In QC Batch MP26456, the MS/MSD recoveries for antimony, nickel and vanadium were identified as being outside QC limits, indicating possible matrix interference. However, the MSD recovery for nickel was actually within the DV QC limits of 75-125%, thereby indicating an acceptable spike recovery. The RPDs for antimony, chromium, nickel, and vanadium were outside QC limits for the duplicate analysis, due to possible sample non-homogeneity. The case narrative identified the

serial dilution results being outside QC limits in QC Batch MP26456 for antimony, chromium, nickel, and vanadium and stated that the percent difference values were acceptable due to low initial sample concentration (<50 times IDL). However, the case narrative also stated that the serial dilution results for each of the affected metals (chromium, nickel, and vanadium) indicated possible matrix interference, thus appearing to be conflicting statements.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the internal standard area counts identified below in MA11248, and the low closing CRDL standard recovery for antimony in analytical sequence MA11253.

The exceptions included the internal standard area count for IS#2 which is associated with chromium and vanadium in analytical run MA11238 for sample JB53603-17. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Consequently, the IS recovery in the affected sample in MA11248, JB53603-17 (125.5%), was less than 130% and apparently, therefore, not reanalyzed, as the IS area counts are considered acceptable by the laboratory representatives.

The closing CRDL standard (CRIA2) recovery for antimony was 68%, a value below the DV QC limits of 70-130%. There was only one PPG sample analyzed in the affected sequence, JB53603-12. Since antimony was detected at a concentration above the affected range (true \pm CRQL), the antimony concentration in JB53603-12 was not subject to qualification (USEPA, 2010).

Hence, no soil sample results warranted qualification for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53603.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis (QC Limits 75-125% Recovery; \leq 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony in QC batches for soil samples were below QC limits in the four QC batches associated with all 28 soil samples, as summarized in Table 2 below. The MSD recovery for chromium in QC Batch MP26451 was above the QC limits of 75 - 125% for QC sample JB53603-2, while the MS/MSD recovery for vanadium and MS recovery for nickel in QC Batch MP26456 were also above the QC limits, as summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. The MS/MSD recoveries for nickel in QC sample displayed confounding results, with the MS recovering below QC limits and the MSD considerably above QC limits. The fact that

the initial sample concentration was almost four times the spike value (3.8 times greater) may have led to some masking of the spike and possibly contributing to the observed resultant conflicting results. Consequently, as there is no clear-cut bias demonstrated by the MS/MSD analyses for nickel, the soil sample nickel results associated with QC Batch MP26455 are qualified as estimated values, but only flagged with "NJ", as there is no definitive bias direction. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26450 Ω	FA10141-8	Antimony	38.2 %	34.1 %	NJ-	Low
MP26451 †	JB53603-2	Antimony	27.1%	35.1 %	NJ-	Low
MP26451 †	JB53603-2	Chromium	95.2 %	136.6 %	NJ+	High
MP26455 £	JB53603-7	Antimony	26.2 %	50.2 %	NJ-	Low
MP26455 £	JB53603-7	Nickel	-29.8 %	238.0 %	NJ	Low/High
MP26456 §	JB53603-12	Antimony	72.5 %	40.7%	NJ-	Low
MP26456 §	JB53603-12	Nickel	520.1 %	124.7 %	NJ+	High
MP26456 §	JB53603-12	Vanadium	568.8%	174.1 %	NJ+	High

QC Limits are 75-125%; Post-digestion spike QC is 80-120%

NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.

NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.

NJ – The matrix spike recovery was outside QC limits; associated sample results are estimated values with indeterminate bias.

MS – Matrix spike

MSD – Matrix spike duplicate

Ω – The samples associated with QC Batch MP26450 consist of JB53603-1, 53603-3 and -4.

† – The samples associated with QC Batch MP26451 consist of JB53603-2, -5, -6, -8 through -11, JB53603-13 through -18 inclusive, and JB53603-20 through -25 (inclusive).

£ – The samples associated with QC Batch MP26455 consist of JB53603-7, and JB53603-26 through -29 (inclusive).

§ – The sample associated with QC Batch MP26456 consists of JB53603-12.

Since none of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits, the sample results subject to qualification for low spike recoveries were flagged with "N" following the DV review to indicate that the result is associated with QC recovery outside QC limits and further flagged with either "J+" or "J-" to indicate the possible presence of a possible high or low bias in the ability to recover the particular analyte in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002), except for the nickel results of QC Batch MP26455, as explained above.

These qualified results are presented below in summary table, Table 7 together with the results qualified for duplicate analysis disparities and serial dilution analysis results.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate soil sample analysis was performed on five QC samples and on five pairs of spiked duplicate samples. Most %RPD values were below the QC limit of 35%RPD for soil samples and the associated results did not require qualification. The duplicate and spike duplicate results in the

QC batch associated with the field blank were also within the 20%RPD QC limits for aqueous samples.

The case narrative stated that the RPDs for antimony, nickel and thallium between the spiked duplicates in QC Batch MP26450 were outside [laboratory] QC limits in this QC batch; however, the values were below the data quality QC limit of 35%RPD for soil samples and, therefore, the associated soil sample results are not subject to qualification. There were large differences between the recovered spike concentrations for antimony, chromium, nickel, and vanadium in QC Batch MP26455. Although the spike amounts differed slightly between the MS and MSD analyses for the QC samples, the differences in the recovered concentrations were large compared to these spike differences that cannot be attributed to the spike differences alone. Consequently it was judged appropriate to qualify the sample results associated with the disparities in the spiked duplicate results of QC Batch MP26455 as estimated values and flag the results with “*J”, as would be done if the duplicate analysis results were outside QC limits.

In QC Batch MP26456, the RPDs for antimony, chromium, nickel, and vanadium were outside QC limits for the duplicate analysis, due to possible sample non-homogeneity.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Duplicate Difference	DV Qualifier
MP26456 §	JB53603-12	Antimony	116.3 %RPD	*J
MP26456 §	JB53603-12	Chromium	109.9 % RPD	*J
MP26456 §	JB53603-12	Nickel	125.8 %RPD	*J
MP26456 §	JB53603-12	Vanadium	129.2 %RPD	*J
QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	
MP26455 £	JB53603-7	Antimony	36.8 %RPD	*J
MP26455 £	JB53603-7	Chromium	52.4 % RPD	*J
MP26455 £	JB53603-7	Nickel	55.9 %RPD	*J
MP26455 £	JB53603-7	Vanadium	80.0 %RPD	*J
QC Limit is 35%RPD; * – Duplicate analysis not within control limits; indeterminate bias direction. J – The reported result is an estimated value. § – The samples associated with QC Batch MP26456 consists of JB53603-12; £ – The samples associated with QC Batch MP26455 consist of JB53603-7, and JB53603-26 through -29 (inclusive).				

Thus, the antimony, chromium, nickel, and vanadium results associated with the duplicate results in QC Batch MP26456 and the spiked duplicate results associated with QC Batch MP26455 are qualified as estimated values and are to be flagged with “*J” due to the potential variability in the analytical precision, though without exhibiting any clear bias direction. When the “*J” qualifiers are combined with the qualifiers associated with the MS/MSD recoveries outside QC limits presented in Table 2, and the serial dilution analysis summarized in Table 4, the sample results with the assigned qualifier designations appear with either “*J”, “*EJ”, “*NJ-”, “ENJ-”, “ENJ+” or “*NJ” in the summary table, Table 7. The duplicate analyses in the remaining QC batches demonstrated acceptable analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 94.2% - 109.2%.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified several serial dilution results as being outside QC limits in SDG JB53603. In QC Batch MP26450, chromium, nickel, and vanadium were identified as being outside QC limits, likely due to sample non-homogeneity. These are detailed in Table 4 below.

The case narrative stated that the RPD(s) for antimony and chromium in the serial dilution analysis in MP26455 were outside QC limits, but that the percent difference values were acceptable due to low initial sample concentration (< 50 times IDL). However, this statement is not correct, since both the antimony and chromium initial concentrations were clearly greater than 50 times the IDL and are, therefore, subject to qualification.

The case narrative identified the serial dilution results being outside QC limits in QC Batch MP26456 for antimony, chromium, nickel, and vanadium and stated that the percent difference values were acceptable due to low initial sample concentration (<50 times IDL). However, the case narrative also stated that the serial dilution results for each of these affected metals (chromium, nickel and vanadium) indicated possible matrix interference, a conflicting statement. It seems that the statement regarding the acceptable percent difference results applied only to antimony.

Table 4. Serial Dilution Results Outside QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26450 Ω	FA10141-8	Chromium	14.8 %D	EJ
MP26450 Ω	FA10141-8	Nickel	14.0 %D	EJ
MP26450 Ω	FA10141-8	Vanadium	12.1 %D	EJ
MP26455 £	JB53603-7	Antimony	14.9 %D	EJ
MP26455 £	JB53603-7	Chromium	11.3 %D	EJ
MP26456 §	JB53603-12	Chromium	28.9 %D	EJ
MP26456 §	JB53603-12	Nickel	29.0 %D	EJ
MP26456 §	JB53603-12	Vanadium	26.2 %D	EJ

EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Ω – The samples associated with QC Batch MP26450 consist of JB53603-1, 53603-3 and -4;
£ – The samples associated with QC Batch MP26455 consist of JB53603-7, and JB53603-26 through -29 (inclusive);
§ – The samples associated with QC Batch MP26456 consists of JB53603-12.

The associated antimony, chromium, nickel, and vanadium results in samples with the identified laboratory sample ID numbers presented in Table 4, are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 7, along with the results qualified for low matrix spike recoveries and variability suggested by the duplicate analysis results.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

One set of field duplicate samples was collected as part of SDG JB53603. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying results from the USEPA CLP program for soil samples analyzed by ICP-AES using the CLP Statement of Work (SOW) ISM01.X (but not Method 6010C) that differ by more than 50%RPD or $> 2 \times$ CRQL (USEPA, 2010; AECOM, 2010).

The results for the analysis of the one pair of field duplicate samples are presented in Table 5, below. It is evident that the results for the metals analytes that were detected in the field duplicate samples were very similar and, thus, considered representative, as the concentrations between field duplicate samples differed by less than 12 %RPD or differed by less than two times the reporting limit value ($< 2 \times$ CRQL) for all analyte pairs, thereby meeting the QC limits for field duplicate samples and demonstrating very good sampling representativeness and precision.

Table 5. Comparison of Field Duplicate Soil Sample Results – SDG JB53603

Analyte	JD002 4-4.5 (mg/Kg)	DUP 20 (mg/Kg)	% RPD	DV Flag
Antimony	< 4.8 NJ-	< 4.4 NJ-	< 2 × CRQL	-
Chromium	19.0 NJ+	20.4 NJ+	7.1 %	-
Nickel	14.6	14.4	1.4 %	-
Thallium	< 2.4	< 2.2	< 2 × CRQL	-
Vanadium	26.7	30.0	11.6 %	-

< – The analyte was not detected at the stated reporting limit.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
 NJ+ – The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
 CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit.
 $< 2 \times$ CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

This pair of field duplicate samples demonstrated acceptable sampling representativeness and precision for the five target metals analyzed.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported vanadium results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where:
- C = Raw instrument reading (µg/L)
 - V = final volume (mL)
 - DF = Dilution factor
 - W = wet weight (g)
 - TS = Total solids (%)
 - 1000 = conversion factor (mL/L)

The vanadium concentration for Sample JD003A 5-5.5 (JB53603-23) was listed as 212 mg/Kg on the reporting form and 4.495 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Vanadium (mg/Kg)} = \frac{(4,495 \mu\text{g/L})(50 \text{ mL}) (1)}{1000(\text{mL/L}) (1.12 \text{ g}) (94.6\%/100\%)} = 212.1244 \mu\text{g/g}$$

$$= 212 \text{ mg/Kg dry weight}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 212 mg/Kg for Sample JD003A 5-5.5 was correctly reported. This value is above the SRS of 78 mg/Kg. Vanadium was detected in three other samples above the SRS criterion.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 22 of the 28 soil samples that had been diluted by a factor of either two, four, five, or ten.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exceptions were instances where two samples were diluted by a factor of 10× and 5×, thereby raising the reporting limit for the antimony and thallium results above the respective SRS, as presented below in Table 6, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 6. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
ID011A 4-4.5	JB53603-20	Antimony	< 0.99	10	< 9.9 NJ-	6
ID011A 4-4.5	JB53603-20	Thallium	< 0.50	10	< 5.0	3
JD003A 5-5.5	JB53603-23	Thallium	< 0.48	5	< 4.8	6

Units – mg/Kg
 < - The analyte was analyzed for, but was not detected above the stated reporting limit.
 NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

The other analyte results associated with the non-detect soil results of antimony and thallium in JB53603-20 were all considerably below the respective SRS values, including the 1.0 mg/Kg Cr+6 result, thereby suggesting a relatively “clean” sample.

The interpretation of the thallium result in JB53603-23 (<4.8) was not compromised by the applied dilution, because the nickel (86.6 mg/Kg), vanadium (212 mg/Kg) and hexavalent chromium (659 mg/Kg) results in JB53603-23 were all above the respective SRS value and, thus, potentially subject to some sort of response action or further evaluation.

Summary

The soil sample analytical results for the samples of SDG JB53603 were found to be compliant with the analytical methods for the analysis of metals in the twenty-eight soil samples using SW-846 Method 6010C.

The QC criteria were met for the ICP target analyte analyses, except for the low matrix spike recoveries, differences in the duplicate analysis and the serial dilution analysis, as summarized in Tables 2, 3, and 4. The associated sample results are qualified accordingly and listed in Table 7 below.

Table 7. Summary of Qualified Sample Metals Results in SDG JB53603

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
KD004 5-5.5	JB53603-1	Antimony	< 4.6	NJ-
KD004 5-5.5	JB53603-1	Chromium	204	EJ

Key:

- < –The analyte was analyzed for, but was not detected above the stated reporting limit.
- J – Indicates an estimated value.
- N – The matrix spike sample recovery in the associated QC sample is not within QC limits.
- J+ – The result is an estimated value, but the result may be biased high.
- J- – The result is an estimated value, but the result may be biased low.
- * – Duplicate analysis not within control limits; indeterminate bias direction.
- E – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one QC batch for the single field blank.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|-----------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Field Duplicate Sample analysis |
| √ Data package completeness | √ Quantitation checks |
| √ Data qualifiers | |

Hexavalent chromium was detected in nineteen of the 28 soil samples, with nine concentrations exceeding the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that the QC requirements were met, including the holding time, method blanks, and matrix spike recoveries, except for the low MS recoveries in QC Batch GP76330. The soluble MS recovery and the post-spike and pH-adjusted post-spike recoveries for QC Batch GP76330 were outside QC limits. The soluble MS recovery in QC Batch GP76332 was outside QC limits but the soluble spike amount was low relative to the sample amount. The RPD for the duplicate analysis in QC Batch GP76332 was outside QC limits, due to possible sample non-homogeneity.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values all exceeding 0.99982 values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 94.3% to 102.4% for the two QC batches associated with the 29 soil samples, and 98.3% to 101.4% for the QC batch associated with the field blank sample, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L), or the field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination. Hexavalent chromium was not detected in the field blank at a reporting limit of 0.010 mg/L.

Matrix Spike Analysis

The matrix spike recoveries were within the QC limits of 75-125%, except for the soluble MS recovery for JB53603-12 in QC Batch GP76332 and the soluble MS, post spike and pH-adjusted post spike recoveries in QC Batch GP76330. The soluble MS recovery for sample JB53603-7 in QC Batch GP76332 was 587.7%, a value considerably above the QC limits. However, since the initial Cr+6 concentration in JB53603-7 was more than four times the spike value, the associated sample results were not subject to qualification, because the low spike amount may have been masked by the sample amount, thereby potentially affecting the spike recovery (NJDEP, 2005).

The low soluble matrix spike recoveries for hexavalent chromium below the QC limits of 75-125% for batch QC Samples JB53603-2 and JB53603-12 indicate possible matrix interference. The other matrix spike recoveries that were within the respective QC limits, are also presented in the summary table, Table 8.

Table 8. Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76330 ¥	JB53603-2	Cr ⁺⁶ , soluble	23.6 %	NJ-	Low
GP76330 ¥	JB53603-2	Cr ⁺⁶ , insoluble	87.8 %	----	----
GP76330 ¥	JB53603-2	Cr ⁺⁶ , post spike	74.9 %	NJ-	Low
GP76330 ¥	JB53603-2	Cr ⁺⁶ , pH-adjusted post spike	78.3 %	NJ-	Low
GP76332 ø	JB53603-7	Cr ⁺⁶ , soluble	578.7 %	****	****
GP76332 ø	JB53603-7	Cr ⁺⁶ , insoluble	119.8 %	---	----
GP76332 ø	JB53603-7	Cr ⁺⁶ , post spike	98.7 %	----	----
GP76332 ø	JB53603-12	Cr ⁺⁶ , soluble	11.2 %	NJ-	Low
GP76332 ø	JB53603-12	Cr ⁺⁶ , insoluble	88.7 %	---	----
GP76332 ø	JB53603-12	Cr ⁺⁶ , post spike	97.1 %	----	----
GN95298 Ø	JB53596-2	Cr ⁺⁶ , soluble	86.7 %	----	----

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 ¥ – The samples associated with QC Batch GP76330 consist of JB53603-1 through -5, and JB53603-20 through -29 (inclusive).
 ø – The samples associated with QC Batch GP76332 consist of JB53603-6 through -18 (inclusive);
 Ø – The sample associated with QC Batch GN95298 consists of field blank JB53603-19.
 **** – The sample concentration was > 4 × spike amount; associated sample results are not subject to qualification.

The soluble MS recovery of 23.6% was below QC limits for Cr⁺⁶ for the spiked sample from sampling location KD004 6-6.5 in the soil sample analysis in QC Batch GP76330 which was associated with 15 soil samples with lab sample IDs of JB53603-1 through -5, and JB53603-20 through -29 inclusive). Despite the 23.6% in GP76330 and the 11.2% soluble MS recovery in GP76332, the results were not rejected, but qualified as estimated values flagged with “NJ-” because the insoluble MS recoveries were within QC limits, an approach found acceptable by Mr. Joseph Sanguiliano of the NJDEP.

In consideration of the DV guidelines that are based on SW-846 Method 7196A (NJDEP, 2005), the hexavalent chromium results for the associated twenty-eight soil samples are, consequently, qualified as estimated values and flagged with “NJ-” due to the potential low bias in the ability to recover this analyte in the soil matrix. These qualified results are presented below in Table 12.

Duplicate Sample Analysis

The duplicate sample analysis was performed on three samples where the differences among the Cr+6, pH, and redox potential were less than 25.4%RPD, except for the 36.1%RPD result in QC sample JB53603-12 in QC Batch GP76332, as depicted in Table 9.

The 36.1%RPD for Cr⁺⁶ was above laboratory QC limits (20%RPD) for the duplicate analysis of Sample JB53603-12 in QC Batch GP76332, but was also above the advisory DV QC guideline of 35%RPD for soil samples (USEPA, 2010; USEPA, 2012). Consequently, the Cr+6 results in the associated samples with laboratory sample ID numbers ranging JB53603-6 through -18 (inclusive) were qualified as estimated values and flagged with ‘*J’ due to a possible variability in the analytical precision. The ‘*’ flag is to indicate that the duplicate analysis of the QC samples were outside QC limits.

Table 9. Duplicate Sample Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
GP76332 ϕ	JB53603-12	Hexavalent Chromium	36.1 %RPD	*J
QC Limit is 35%RPD; J – The reported result is an estimated value. * – Duplicate analysis not within control limits; indeterminate bias direction. ϕ – The samples associated with QC Batch GP76332 consist of JB53603-6 through -18 (inclusive).				

The other duplicate analyses met QC requirements with values less than 25.4 %RPD, including Cr+6, redox potential and pH analyses. The qualified results are identified in the summary table presented at the end of this DV report in Table 12.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries between 97.5% and 100.1% for the soil sample analyses, and 93.3% for the analysis associated with the field blank, thereby demonstrating acceptable analytical system performance.

Field Duplicate Analysis

The results for the analysis of one pair of field duplicate samples are presented in Table 10, below. It is evident that the results of the two non-detected results of sample JD002 4-4.5 and its field duplicate were identical non-detect values with the same reporting limit, thereby meeting the QC limit of $\leq 2 \times$ CRQL (AECOM, 2010; USEPA, 2010).

Table 10. Comparison of Field Duplicate Soil Sample Results – SDG JB53603

Analyte	JD002 4-4.5 (mg/Kg)	DUP 20 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	< 0.44 NJ-	< 0.44 NJ-	< 2 \times CRQL	-
< – The analyte was not detected at the stated reporting limit NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is not within QC limits; possible low bias. CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit. < 2 \times CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.				

The difference between the non-detect results of field duplicate samples from JD002 4-4.5 was obviously less than the QC limit of $< 2 \times$ CRQL (AECOM, 2010). Thus, the two results are not qualified and demonstrate excellent sampling representativeness and precision.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample LD008A 5-5.5 (JB53603-7) was listed as 710 mg/Kg on the reporting form and 0.3419 mg/L on the quantitation report in the raw data for a 50-fold dilution analysis. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.3419 \text{ mg/L} \times 0.1 \text{ L} \times 50}{0.00256 \text{ Kg} \times 94.1/100} = \frac{1.7095}{0.0024090} = 709.6423 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 710 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 710 mg/Kg for Sample LD008A 5-5.5 was correctly reported. This was the highest detected Cr+6 concentration detected among the 28 soil samples of this SDG, JB53603 analyzed for hexavalent chromium. This was one of nine detected Cr+6 concentrations result above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No other disparities relative to the reported values and characteristics were observed. All results met the QC limits, such that no pH or redox potential (ORP) results are subject to qualification.

All but seven of the 28 soil samples fell below the Eh-pH phase diagram line. These results suggest that most of the samples experience conditions of a "reducing" soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. Of the seven samples experiencing "oxidizing" conditions, the highest detected Cr+6 concentration was 710 mg/Kg in JB53603-7; the total chromium result from its ICP analysis was 1240 mg/Kg. Of the six remaining sample Cr+6 results above the Eh-pH line, each exhibited a Cr+6 result above the SRS with corresponding total chromium values ranging from 148 to 1200 mg/Kg Cr. Consequently, the seven results above the SRS are expected to be remediated or further evaluated.

Summary of Cr+6 Results in SDG JB53603

Due to the low MS recoveries for the soluble spike in QC batches GP76330 and GP76332 associated with 28 soil samples, the Cr⁺⁶ results in the associated 28 soil samples are qualified as estimated values and flagged with "NJ-" due to a low soluble MS recovery. Samples JB53603-6 through -18 (inclusive) were also qualified because the duplicate analysis result was above QC limits. These results when combined with the qualification for the low MS recovery are found flagged with "*NJ-" in comprehensive Table 12. No other Cr+6 results were subject to qualification

in the hexavalent chromium analyses, or the pH, redox potential or total solids analyses. The Cr+6 results qualified due to low Cr⁺⁶ spike recoveries in the soluble MS analysis following the DV review are presented in Table 12 near the end of this DV report and compared to results from their reanalysis.

Because the soluble MS recovery values were below QC limits in QC batches GP76330 and GP76332, the samples required reanalysis where the resultant data are presented in SDG JB53603R and summarized in this report in sections below under the subsection labeled "SDG JB53603R".

SDG JB53603R

Because the soluble MS recoveries in the initial soil sample analysis for hexavalent chromium were below the QC limit of 75% for the spike recoveries associated with the twenty-eight (28) soil samples, the 28 soil samples of SDG JB53603 were reanalyzed for hexavalent chromium. The soil samples numbered JB53603-1R through -18R and JB53603-20R through -29R were re-analyzed and the data submitted in a supplemental data package labeled JB53603R (R for reanalysis). The samples were re-prepped on December 5 and reanalyzed December 8, 2013 for Cr⁺⁶, within the 30-holding time for soil samples. The samples present in SDG JB53603R are identified in Table 1, but are labeled with the suffix 'R' in the laboratory sample ID number such as JB53603-12R for the reanalysis of client ID sample ID011A 2-2.5, which was the sample used as one of the QC samples in SDG JB53603R. Hexavalent chromium was detected in 24 of the 28 soil samples reanalyzed with nine Cr+6 results above the SRS of 20 mg/Kg.

The case narrative of SDG JB53603R indicated that the QC requirements were met for the reanalysis of the soil samples of SDG JB53451R, except that the soluble MS recoveries were outside QC limits in both QC batches. However, the Cr+6 results associated with QC batch GP76469 were not subject to qualification despite the -18.7% spike recovery because the initial sample concentration was considerably more than the spike amount and the MS recoveries in another QC sample in this batch were within QC limits, as presented in Table 11 below.

Calibrations

The initial calibration for both QC batches in the analytical sequence of 12/8/13 demonstrated an acceptable correlation coefficient with the value of 0.99981, a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 94.6% to 100.2% for the QC batches associated with the 28 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blank (< 0.40 mg/Kg), or any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike (MS) recovery for the soluble matrix spike was below QC limits in the re-analysis of JB53603-2R from soil sampling location KD004 6-6.5. Thus, the hexavalent chromium results for samples with laboratory sample ID numbers JB53603-1R through -5R, and JB53603-20R through -29R (inclusive) are still subject to qualification to be flagged with "NJ-".

Table 11. Matrix Spike Recovery Results in SDG JB53603R

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76468 ¥	JB53603-2R	Cr ⁺⁶ , soluble	59.3 %	NJ-	Low
GP76468 ¥	JB53603-2R	Cr ⁺⁶ , insoluble	81.5 %	----	----
GP76468 ¥	JB53603-2R	Cr ⁺⁶ , post spike	93.6%	----	----
GP76469 ¢	JB53603-7R	Cr ⁺⁶ , soluble	-18.7 %	****	****
GP76469 ¢	JB53603-7R	Cr ⁺⁶ , insoluble	106.6 %	----	----
GP76469 ¢	JB53603-7R	Cr ⁺⁶ , post spike	93.3 %	----	----
GP76469 ¢	JB53603-12R	Cr ⁺⁶ , soluble	79.2 %	----	----
GP76469 ¢	JB53603-12R	Cr ⁺⁶ , insoluble	93.1 %	----	----
GP76469 ¢	JB53603-12R	Cr ⁺⁶ , post spike	97.1%	----	----

QC Limits are 75-125% for MS Recovery; 85-115% for post spike recovery.
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 ¥ – The samples associated with QC Batch GP76468 consist of JB53603-1R through -5R, and JB53603-20R through -29R (inclusive);
 ¢ – The samples associated with QC Batch GP76469 consist of JB53603-6R through -18R (inclusive).
 **** – The sample concentration was > 4 × spike amount; associated sample results are not subject to qualification.

The NJDEP DV guidelines for Cr+6 specify 75-125% as the MS QC limits, with post-digestion spike recovery limits of 85-115%. Consequently, the associated hexavalent chromium results of the soil samples with ID number JB53603-1R through -5R and JB53603-20R through -29R (inclusive) were still subject to qualification following the DV review. The sample Cr+6 results associated with the elevated soluble MS recovery in JB53603-7R are not subject to qualification because the samples concentration (615 mg/Kg) was considerably more than four times the applied MS amount (42.7 mg/Kg) such that it was likely that the sample amount masked (dwarfed) the spike amount (NJDEP, 2005). The results of the analysis of another sample (JB53603-12R) exhibited acceptable MS recoveries, seemingly supporting the action of not qualifying the associated sample results.

These qualified Cr+6 results from the reanalysis are presented alongside those of the initial analysis in Table 12.

Duplicate Sample Analysis

Three soil samples were analyzed in duplicate with differences all less than 14%RPD, values less than the DV QC limit of 35%RPD, thereby demonstrating excellent analytical precision.

The difference between Cr+6 concentrations of field duplicate samples from JD002 4-4.5 was greater than two times the reporting limit (CRQL), a value above the QC limit (AECOM, 2010; USEPA, 2010). Consequently, both Cr+6 results for JB002 4-4.5 and DUP 20 are subject to qualification as estimated values and are flagged with “J” in Table 12 below.

Laboratory Control Sample (LCS) Analysis

The LCS recoveries were acceptable and within QC limits of 80-120%, with recoveries of ranging from 89.8% and 97.4%, thereby demonstrating acceptable analytical system performance.

Sample Result Verification

The detected hexavalent chromium concentration for Sample LD008A 5-5.5 (JB53603-7R) was listed as 615 mg/Kg on the reporting form and 0.2880 mg/L on the quantitation report in the raw data for a 50-fold dilution analysis. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.2880 \text{ mg/L} \times 0.1 \text{ L} \times 50}{0.00249 \text{ Kg} \times 94.1/100} = \frac{1.4400}{0.0023431} = 614.5731 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 615 \text{ mg/Kg}$$

After rounding to 3 significant figures, this verifies that the hexavalent chromium concentration of 615 mg/Kg for Sample LD008A 5-5.5 was correctly reported.

SDG JB53603RT

The reducing conditions in the soil matrix appear supported by the TOC, S⁻ screen and Fe⁺² data. The associated QC results for the blank spike, duplicate analysis and the MS results were all within the specified QC limits demonstrating acceptable accuracy and precision.

The supporting analyses (ferrous iron, sulfide screen, and TOC) were analyzed on Sample JB53603-2RT (KD004 6-6.5), a sample which was analyzed twice without detecting a concentration of Cr+6 above 0.74 mg/Kg. The three supporting parameters were analyzed outside the respective holding times in order to provide more information about the possible impact of the sample matrix on the Cr+6 recoveries. Professional judgement was applied in not qualifying these results for the holding time exceedances. According to the method, these analyses should be performed on the sample experiencing the low spike recoveries; the soluble MS/MSD recoveries for this QC sample were 27.1% and 19.7%.

The detected ferrous iron (1.0%) and TOC concentration (84,000 mg/Kg) results in JB53603-2RT are at comparable levels with samples in the research literature identified as exhibiting “reducing” soil conditions (Brose and James, 2013; Jardine, et al., 1999), as also indicated on the Eh-pH phase diagram. Thus, the results of the supplemental analyses support the soil conditions being of a “reducing” environment. The “reducing” conditions in the soil matrix of a soil sample falling below the Eh-pH phase line are thereby supported by the TOC, Fe⁺² and Eh-pH data.

Summary for Hexavalent Chromium Analysis

The soil sample results from the initial analysis are presented alongside those obtained from the reanalysis of samples in SDG JB53603 below in Table 12. The Cr+6 results of the reanalysis appear to be comparable to those of the initial analysis, both associated with low MS recoveries and possibly suggesting a potential low bias in the ability to recover this analyte in the given sample matrix. Even the results of the duplicate analysis in the initial analysis of the QC sample associated with samples JB53603-6 through -18 (inclusive) which suggested possible variability in the analytical precision of samples in this batch did not appear to affect then results observed in the reanalysis.

Table 12. Comparison of Qualified Sample Cr⁺⁶ Results in SDGs JB53603 and JB53603R

Client ID	Lab Sample ID	Analyte	JB53603 Result (mg/Kg)	DV Qualifier	JB53603R Result (mg/Kg)	DV Qualifier
KD004 5-5.5	JB53603-1	Cr+6	11.8	NJ-	12.4	NJ-

JD003A 5-5.5	JB53603-23	Cr+6	659	NJ-	614	NJ-
JD003A 6-6.5	JB53603-24	Cr+6	131	NJ-	137	NJ-
JD003A 7-7.5	JB53603-25	Cr+6	6.1	NJ-	5.1	NJ-
JD003A 10-10.5	JB53603-26	Cr+6	1.8	NJ-	1.5	NJ-
JD003A 11-11.5	JB53603-27	Cr+6	< 0.51	NJ-	< 0.51	NJ-
LD001 2-2.5	JB53603-28	Cr+6	90.6	NJ-	73.6	NJ-
LD001 4-4.5	JB53603-29	Cr+6	36.7	NJ-	26.9	NJ-

< – The analyte was analyzed for, but not detected at the specified reporting limit.
J – The reported result is an estimated value;
NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is below QC limits; potential low bias;
*J – Duplicate analysis not within control limits; the value is estimated with indeterminate bias direction.

Review of Table 12 indicates that the Cr+6 results from both the initial and the re-analysis are remarkably comparable, even considering the potential for disparities attributable to soil sample non-homogeneity.

SDG JB53603T

One soil sample, LD001 4-4.5 (JB53603-29T), was re-analyzed for the five target metals. All QC requirements were met during the re-analysis of this sample, such as calibration, QC blanks, duplicate analysis, etc., except for the low MS/MSD recoveries for antimony in the QC sample.

The MS/MSD recoveries for antimony were below QC limits, as itemized in Table 13. Consequently, the antimony result in JB53603-29T was qualified as an estimated value and flagged with "NJ-" due to the potential low bias in the associated QC sample.

Table 13. Matrix Spike Recovery Results Outside QC Limits in JB53603T

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26737 Ж	FA11966-1	Antimony	39.8 %	39.1 %	NJ-	Low
QC Limits are 75-125%; NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. MS – Matrix spike MSD – Matrix spike duplicate Ж – The sample associated with QC Batch MP26737 consists of JB53603-29T.						

The duplicate soil sample analysis was performed on a non-client QC sample where all results were below QC limits. The case narrative stated that the RPD for vanadium in the duplicate analysis was outside control limits. However, closer review of the data during the D V review indicated that the difference between the duplicate results was actually less than 2 × CRQL, thereby meeting QC limits for soil, such that the associated sample vanadium result was not subject to qualification.

The antimony and nickel result for Sample JB53603-29T exceeded the respective SRS criteria, with concentrations of 14.4 and 114 mg/Kg, respectively. The qualified antimony result is presented below in Table 14.

Table 14. Summary of Qualified Sample Metals Results in SDG JB53603 T

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
LD001 4-4.5	JB53603-29T	Antimony	14.4	NJ-
Key: NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.				

No other soil sample target metals results required any qualification for any associated QC issues.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference.

Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB53603/JB53603R/RT/T

1. Were the appropriate sample preservation requirements met?..... Yes No
 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
 If "No", provide a brief explanation.

3. Were the samples diluted? Yes No
 Indicate the identity of the samples and why.

Matrix interference for metal analysis at high Cr⁺⁶ concentrations above calibration range.
 (2x) JB53603-2, 3, 8, 15, 29. Cr⁺⁶: JB53603-7, 23 (50x)
 (4x) - 9, 22, 24, 26 JB53603-11, 12, 21, 24
 (5x) - 1, 4, 5, 6, 7, 10, 14, 16, 18, 21, 23, 28 | and 28 (5x).
 (10x) - 20

4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
 If "Yes", list the affected samples.

Antimony in JB53603-20
 Thallium in JB53603-20, 23

5. Were any applicable standards exceeded for any samples? Yes No
 If "Yes", include the number of samples and laboratory sample ID numbers.

Eight nickel: JB53603-3, 7, 17, 21, 23, 25, 28, 29.
 Four vanadium: JB53603-7, 21, 23, 28.
 One antimony: JB53603-21.
 Nine Cr⁺⁶: JB53603-7, 12, 15, 21, 23, 24, 28, 29, 11.

6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
 If "No", provide a brief explanation of action taken.

7. Were qualifications noted in the non-conformance summary?..... Yes No
 Provide a brief explanation.

*Refer to DV report discussions of case narrative regarding QC limit exceedances.
 No analytical/procedural problems were noted.*

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *NA*

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, 8, 9, 11 and 13 for details.

Qualified sample results are presented in Tables 7, 12 and 14 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB53706A
Sample Date: November 20, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: February 28, 2014

This data validation (DV) report presents the data review and result qualifications for fifteen (15) soil samples and one field blank (FB) collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 20, 2013 for sample delivery group (SDG) JB53706A. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53706A were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 15 collected soil samples and one FB.

Following the detailed DV review, the following sample results were qualified:

- Antimony (*NJ-) in Samples JB53706-9 through -18 (inclusive), and JB53706-20 through -24 (inclusive).
- Chromium (*EJ) in Samples JB53706-9 through -18 (inclusive), and JB53706-20 through -24 (inclusive).
- Nickel (*ENJ+) in Samples JB53706-9 through -18 (inclusive), and JB53706-20 through -24 (inclusive).
- Vanadium (*ENJ+) in Samples JB53706-9 through -18 (inclusive), and JB53706-20 through -24 (inclusive).

No other sample results in SDG JB53706A required qualification, including hexavalent chromium results, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for antimony in seven soil samples and nickel in two soil samples. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

The sample results that were subject to qualification following the DV review are presented in Table 5 of this DV report.

Sample Receipt

The fifteen (15) soil samples collected November 20, 2013, were received November 20, 2013 at the Accutest laboratory in Dayton, NJ intact and chemically preserved with acceptable sampling cooler temperatures of 4.1°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. on November 22, 2013 in good condition with sampling cooler temperatures of 3°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
ID005 4.5-5	JB53706-9	11/20/13	Soil	Metals, Cr+6
ID005 5.5-6	JB53706-10	11/20/13	Soil	Metals, Cr+6
ID005 6.5-7	JB53706-11	11/20/13	Soil	Metals, Cr+6
ID005 7.5-8	JB53706-12	11/20/13	Soil	Metals, Cr+6
ID005 8.5-9	JB53706-13	11/20/13	Soil	Metals, Cr+6
ID006 4-4.5	JB53706-14	11/20/13	Soil	Metals, Cr+6
ID006 5-5.5	JB53706-15	11/20/13	Soil	Metals, Cr+6
ID006 6-6.5	JB53706-16	11/20/13	Soil	Metals, Cr+6
ID006 7-7.5	JB53706-17	11/20/13	Soil	Metals, Cr+6
ID006 8-8.5	JB53706-18	11/20/13	Soil	Metals, Cr+6
FB 15	JB53706-19	11/20/13	Aqueous	Metals, Cr+6
ID007 4-4.5	JB53706-20	11/20/13	Soil	Metals, Cr+6
ID007 5-5.5	JB53706-21	11/20/13	Soil	Metals, Cr+6
ID007 6-6.5	JB53706-22	11/20/13	Soil	Metals, Cr+6
ID007 7-7.5	JB53706-23	11/20/13	Soil	Metals, Cr+6
ID007 8-8.5	JB53706-24	11/20/13	Soil	Metals, Cr+6

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast in Orlando, Florida.
Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB53706A, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (✓) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| ✓ Holding times | Matrix spike recoveries |
| ✓ Blank Analysis | Duplicate analysis |
| ✓ Calibration standards | ✓ Laboratory control samples |
| ✓ Calibration verification | Serial dilution analysis |
| ✓ ICP Interference Check Sample | ✓ Quantitation checks |
| ✓ Data package completeness | ✓ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Soil sample results did not exhibit concentrations above the respective site remediation standard (SRS) levels in the 15 soil samples of this SDG, except for seven antimony and two nickel results.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony, nickel and vanadium were identified as being outside QC limits for a non-client sample in QC batch MP26456. The RPD for the duplicate analysis of a non-client QC sample for antimony, chromium, nickel and vanadium were outside QC limits in QC Batch MP26456 due to possible sample non-homogeneity. The case narrative identified the serial dilution results being outside QC limits in the QC batch for antimony, chromium, nickel and vanadium and stated that the percent differences were acceptable due to low initial sample concentrations. The case narrative also stated in conflicting statements that the serial dilution results were outside QC limits in the QC batch for chromium, nickel and vanadium and the differences were probably due to sample non-homogeneity. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

The QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There were, however, a few exceptions. The recovery of antimony in the closing CRI standard of analytical sequence MA11253 was 68%, a value marginally below the QC limit range of 70-130% (USEPA, 2010). The non-detect results of samples JB53706-12, -13, and -18 could be subject to qualification, but these results did not warrant qualification, because the reporting limits of the samples involved were above the "affected range" of approximately 0- 0.6 mg/Kg (true spike \pm CRQL) and also, there is no CRDL standard analysis requirement in Method 6010C (NJDEP, 2002). Additionally, the results for antimony in these samples are already qualified as estimated values for the low MS recoveries and results are flagged with "NJ-".

The antimony result in the field blank, FB 15, was subject to qualification because the CRI standard recovered only 64% in the closing standard associated with the sequence for the field blank analysis which was analyzed shortly prior to the CRI standard. The non-detect antimony result in the field blank was qualified as an estimated value due to low CRI standard recovery and because the non-detected result falls within the affected range of the CRI standard analysis.

There was one instance where the internal standard (IS#2) area count was above the identified QC limits in JB53706-12. Internal standard IS#2 is associated with chromium and vanadium. In the analytical sequence MA11253, the area count for IS #2 in JB53706-12 was identified as being outside QC limits on the QC summary report. However, based on control charts within the laboratory, the QC limits have been updated to 70-130%. Review of the data revealed that the area count for IS#2 (125%) was actually within the previous QC limits of 60-125%. Thus, this sample did not warrant reanalysis and the results for chromium and vanadium are considered acceptable for this sample. Consequently, the affected sample in MA11253, JB53706-12 was not reanalyzed, as the IS area counts is considered acceptable.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or the field blank, at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53706A.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis (QC Limits 75-125% Recovery; \leq 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony, nickel, and vanadium were outside QC limits of 75 - 125% for a PPG sample from another SDG which served as the QC sample in QC Batch MP26456 which are summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Following the DV review, the sample results subject to qualification for spike recoveries outside QC limits were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential low bias or "J+" for a potential positive bias in the ability to recover the affected analyte in the given sample matrix,

in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26456 Ω	JB53603-12	Antimony	72.5 %	40.7 %	NJ-	Low
MP26456 Ω	JB53603-12	Nickel	520.1 %	124.7 %	NJ+	High
MP26456 Ω	JB53603-12	Vanadium	568.8 %	174.1 %	NJ+	High
QC Limits are 75-125%; NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. NJ+ – The matrix spike recovery was below QC limits; associated sample results may experience a potential high bias. MS – Matrix spike MSD – Matrix spike duplicate. Ω – The samples associated with QC Batch MP26456 consist of JB53706-9 through -18 (inclusive) and JB53706-20 through -24 (inclusive).						

Although the QC sample in this QC batch was a PPG sample from another SDG, the initial sample results for the analyzed analytes were similar to those concentration levels observed in PPG samples of this SDG. Consequently, it was judged appropriate to qualify the associated PPG soil sample results for this batch on the basis of the QC results. The antimony results in all of these affected samples are flagged with “NJ-” due to a potential low bias, while the nickel and vanadium results are qualified as estimated values and flagged with “NJ+” due to a potential positive (high) bias. These qualified results are presented below in summary table, Table 5, together with the results qualified for duplicate analysis and serial dilution analysis results.

The MS/MSD recoveries for chromium were considerably above QC limits, but the associated sample results were not qualified because the initial sample concentration was more than four times the spike value; sample results are not subject to qualification due to possible masking of the spike by the large initial sample concentration (USEPA, 2010; NJDEP, 2002).

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on a PPG sample from another SDG whose target analyte concentrations were not unlike those observed in the present PPG soil samples. The %RPD values were above the QC limit of 35%RPD for soil samples (USEPA, 2010) as depicted below in Table 3. A possible cause of the observed differences between the duplicate results may be attributable to sample non-homogeneity.

Table 3. Duplicate Analysis Results Outside QC Limits

QC Batch	QC Sample	Analyte	Spiked Duplicate Difference	DV Qualifier
MP26456 Ω	JB53603-12	Antimony	116.3 %RPD	*J
MP26456 Ω	JB53603-12	Chromium	109.9 %RPD	*J
MP26456 Ω	JB53603-12	Nickel	125.8 %RPD	*J
MP26456 Ω	JB53603-12	Vanadium	129.2%RPD	*J

QC Limit is 35%RPD;

* – Duplicate analysis not within control limits; indeterminate bias direction.

J – The reported result is an estimated value.

Ω – The samples associated with QC Batch MP26456 consist of JB53706-9 through -18 (inclusive) and JB53706-20 through -24 (inclusive).

Thus, the antimony, chromium, nickel and vanadium results associated with QC Batch MP26456 are qualified as estimated values and are to be flagged with “*J” due to the potential variability in the analytical precision, though without exhibiting any clear bias direction. When the “*J” qualifiers are combined with the qualifiers associated with the low antimony MS/MSD recoveries in the QC sample of this batch, the antimony results appear with “*NJ-” in the summary table, Table 5, while the chromium, nickel and vanadium results appear as “*EJ”, “*ENJ+”, and “*ENJ+”, respectively.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 101.0% - 109.2% for the soil sample metals analysis in QC Batch MP26456, and 95.5% to 106.0% for the batch containing the field blank (MP26446).

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative also stated that the RPDs for antimony, chromium, nickel, and vanadium are outside QC limits in QC Batch MP26456, but that the percent difference values were acceptable due to the low initial sample concentration (<50 times IDL). In situations where the initial sample concentration is less than 50 times the instrument detection limit (IDL), the serial dilution result does not meet the criterion for data validation qualification (USEPA, 2010). However, in the same case narrative, it was also stated in conflicting statements that the serial dilution results were outside QC limits in the QC batch for chromium, nickel and vanadium and the differences were probably due to sample non-homogeneity. A review of the data indicated that the first statement should pertain only to antimony, and that the serial dilution results were above the QC limit of 10%D for chromium, nickel, and vanadium, as summarized below in Table 4. Thus, these affected results in the samples associated with this elevated %D exceedance are subject to qualification following the DV review, as discussed below.

Table 4. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26456 Ω	JB53603-12	Chromium	28.9 %D	EJ
MP26456 Ω	JB53603-12	Nickel	29.0 %D	EJ
MP26456 Ω	JB53603-12	Vanadium	26.2 %D	EJ

Note –
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
Ω – The samples associated with QC Batch MP26456 consist of JB53706-9 through -18 (inclusive) and JB53706-20 through -24 (inclusive).

The associated chromium, nickel, and vanadium results in samples with laboratory sample ID numbers ranging JB53706-9 through -18 (inclusive) and JB53706-20 through -24 (inclusive), are qualified as estimated values and flagged with “EJ” to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 5, along

with the results qualified for matrix spike recoveries and duplicate analysis results outside QC limits.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported antimony results:

$$\text{Antimony (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The antimony concentration for Sample ID005 4.5-5 (JB53706-9) was listed as 106 mg/Kg on the reporting form and 2.270 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Antimony (mg/Kg)} &= \frac{(2.270 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.21 \text{ g})(88.5/100\%)} = 105.9905 \mu\text{g/g} \\ &= 106 \text{ mg/Kg, dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the antimony concentration of 106 mg/Kg for Sample ID005 4.5-5 was correctly reported.

Reporting Limits

Six of the fifteen samples were diluted; however, all reporting limits were still below the respective SRS values.

Summary

The soil sample analytical results for the samples of SDG JB53706A were found to be compliant with the analytical methods for the analysis of metals in the fifteen (15) soil samples using SW-846 Method 6010C.

Several matrix spike recoveries in the QC sample were outside QC limits, such that the antimony results are qualified due to a potential low bias (NJ-), while the detected nickel and vanadium results are qualified as estimated values due to a potential positive (high) bias in the associated samples (flagged NJ+), as detailed in Table 5. Because there were differences between the duplicate analysis of the QC sample that were greater than the QC limit, the antimony, chromium, nickel and vanadium results are also qualified as estimated values and flagged with “*” in addition to either the “NJ” and/or “E” flags to indicate that there may be potential variability in the analytical precision in the reported results, as well, presumably due to possible sample non-homogeneity, but with no bias direction attributable to this potential variability.

The serial dilution results for chromium, nickel and vanadium in the QC sample of QC Batch MP26456 were above the QC limit of 10.0 %D, suggesting potential variability in the reported

results due to the presence of interference in the matrix, such that the identified chromium, nickel and vanadium sample results are qualified as estimated values and are flagged with "EJ" in 15 samples, as presented below in Table 5.

Table 5. Summary Qualified Sample Metals Results in SDG JB53706A

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
ID005 4.5-5	JB53706-9	Antimony	106	*NJ-
ID005 4.5-5	JB53706-9	Chromium	15.3	*EJ

ID007 8-8.5	JB53706-24	Chromium	8.9	*EJ
ID007 8-8.5	JB53706-24	Nickel	10.2	*ENJ+
ID007 8-8.5	JB53706-24	Vanadium	6.4	*ENJ+

Key:

- < – The analyte was analyzed for, but was not detected above the stated reporting limit.
- * – The duplicate analysis result in the associated QC sample is not within QC limits.
- J – The reported result is an estimated value.
- N – The matrix spike sample recovery in the associated QC sample is not within QC limits.
- J- – The result is an estimated value, but the result may be biased low.
- J+ – The result is an estimated value, but the result may be biased high.
- EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the soil samples and one for the field blank analysis.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ Quantitation checks | √ Data qualifiers |
| √ Data package completeness | |

Hexavalent chromium was detected in 10 of 15 soil samples analyzed in SDG JB53706A with detected concentrations of 12.1 or less, such that no Cr+6 results had exceeded the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values exceeding 0.9999, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 93.0% to 97.0% for the QC batch associated with the 15 soil samples and 93.8% to 94.0% for the batch associated with the field blank, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L) or the field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 6. No hexavalent chromium results required qualification based on the results of the MS recoveries.

Table 6. Hexavalent Chromium Analysis Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GN95380	JB53683-4	Cr ⁺⁶ , soluble	106.7 %	----	----
GP76344	JB53706-10	Cr ⁺⁶ , soluble	87.5 %	----	----
GP76344	JB53706-10	Cr ⁺⁶ , insoluble	94.7 %	----	----
GP76344	JB53706-10	Cr ⁺⁶ , post-spike	90.1 %	---	----

QC Limits are 75-125% for MS recovery; 85-115% for post-spike recovery
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium

Duplicate Sample Analysis

The 14.0%RPD result for the duplicate redox potential analysis was the highest result observed in the general chemistry set of duplicate analyses, a value within laboratory QC limits, as well as the 35%RPD project QC limit for soil samples (AECOM, 2010). All other duplicate analyses met QC requirements with values of 0.0 %RPD for Cr+6 in both matrices and pH analyses. Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 88.0% to 100.0%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in either of the two analytical sequences. Serial dilution analysis is not a requirement of the analytical method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample ID006 6-6.5 (JB53706-16) was listed as 12.1 mg/Kg on the reporting form and 0.2681 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.2681 \text{ mg/L} \times 0.1 \text{ L} \times 1}{0.00244 \text{ Kg} \times 87.7/100} = \frac{0.02681}{0.0022204} = 12.0744 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 12.1 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 12.1 mg/Kg for Sample ID005 6-6.5 is correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 15 soil samples of this SDG, JB53706A. Thus, all detected Cr⁺⁶ concentration results were below the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

The pH and Eh results were compared to the Eh-pH phase diagrams and verified that the sample points are correctly located on the diagrams. All sample results were observed to fall under the Eh-pH phase diagram line, thereby demonstrating "reducing" conditions. Hexavalent chromium was detected in ten of the fifteen soil samples of JB53706A at concentrations of 12.1 mg/Kg or less, thus, were all below the SRS of 20 mg/Kg.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were within QC limits, as were all other QC results associated with the hexavalent chromium analysis, including the duplicate sample analysis, no Cr⁺⁶ results were qualified following the DV review.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 53706 A

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? *for metals analysis* Yes No

Indicate the identity of the samples and why. *Matrix interference*
(2x) JB 53706 - 11, 17, 20
(4x) JB 53706 - 9
(5x) JB 53706 - 14, 21

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Antimony in 7 samples : JB 53706 - 9, 10, 14, 16, 22, 23, 24
Nickel in 2 samples : JB 53706 - 11, 17

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No problems with analytical procedures were noted.

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:
11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3 and 4 for details.

Minor issue regarding calibration issue is presented in DV report text.

Qualified sample results are presented in Table 5 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB53885
Sample Date: November 20 and 21, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga, Ph.D., REP5554
Report Date: February 19, 2014

This data validation (DV) report presents the data review and result qualifications for thirty-three (33) soil samples and one field blank (FB) collected at PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 20 and 21, 2013 for sample delivery group (SDG) JB53885. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey and Accutest Laboratories Southeast in Orlando, Florida.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53885 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr^{+6}) in the 33 collected soil samples and one FB.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53885-1 through -12 (inclusive), JB53885-25 through -33 (inclusive) and JB53885-35 through -46 (inclusive).
- Chromium (EJ) in Samples JB53885-31 through -33 (inclusive), and JB53885-35 through -46 (inclusive).
- Nickel (EJ) in Samples JB53885-1 through -12 (inclusive), JB53885-25 through -33 (inclusive) and JB53885-35 through -46 (inclusive).
- Vanadium (EJ) in Samples JB53885-1 through -12 (inclusive), JB53885-25 through -33 (inclusive) and JB53885-35 through -46 (inclusive).

No other sample results in SDG JB53885 required qualification, including hexavalent chromium results, based on the acceptable associated QC results and analytical performance. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for two nickel, two vanadium, and two hexavalent chromium results. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

The sample results that were subject to qualification following the DV review are presented in Table 6 and Table 9 of this DV report.

Sample Receipt

The thirty-three (33) soil samples and one field blank collected November 20 and 21, 2013, were received November 21, 2013 at the Accutest laboratory in Dayton, NJ intact and chemically preserved with acceptable sampling cooler temperatures of 3.4°C. The samples designated for metals analysis were received at the Accutest Laboratories Southeast, Inc. on November 23, 2013 properly preserved and intact with sampling cooler temperatures of 3.8°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
ID001 5-5.5	JB53885-1	11/21/13	Soil	Metals, Cr+6

ID001 4-4.5	JB53885-46	11/21/13	Soil	Metals, Cr+6

Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C at Accutest Laboratories Southeast in Orlando, Florida.
 Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.

Data Review

Data, as presented in the analytical data package SDG JB53885, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) "*National Functional Guidelines for Inorganic Data Review*", OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006);
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005).

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Soil sample results did not exhibit concentrations above the respective site remediation standard (SRS) levels in the 33 soil samples of this SDG, except for two nickel and two vanadium results.

Laboratory Case Narrative

The case narrative identified that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were outside QC limits for samples ID001 5-5.5 and ID002 6.5-7 in QC

batches MP26457 and MP26466 due to possible matrix interference and/or sample non-homogeneity. The case narrative identified the serial dilution results being outside QC limits for nickel and vanadium in QC Batch MP26457 due to possible sample non-homogeneity. The case narrative also identified the serial dilution results (RPDs) as being outside QC limits in QC Batch MP26466 for chromium, nickel and vanadium and stated that the percent differences were acceptable due to low initial sample concentrations. However, inspection of the data revealed that the concentrations of all three of these analytes were actually above 50 × IDL and, therefore, outside QC limits in MP26466. All other QC requirements were met, including analyses for pH, oxidation reduction potential, and total solids. Details are discussed in the sections below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

The QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard) and high calibration standard (when analyzed), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination). There was, however, one exception.

The recovery of antimony in the closing CRI standard of analytical sequence MA11258 was 64%, a value marginally below the QC limit range of 70-130% (USEPA, 2010). The antimony result in the field blank, FB 16, was subject to qualification because the CRI standard recovered only 64% in the closing standard associated with the sequence for the field blank analysis. However, since the FB was analyzed much closer to the CRIA1 standard with an acceptable 116.0% recovery at the beginning of the sequence than the closing CRIA2 standard, it was judged appropriate to not qualify the antimony in FB16, since the initial CRDL standard is more likely representative of analytical conditions in the early portion of the sequence than the closing CRDL standard. In addition, there is no requirement for the analysis of a CRDL standard in USEPA Method 6010C and there is no guidance presented in the DV guidelines (NJDEP, 2002). Hence, the antimony result in FB 16 is not flagged in Table 6.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blanks, the continuing calibration blanks, or the field blank, at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53885.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis (QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were outside QC limits of 75 - 125% for PPG samples JB53885-1 and -31 in both QC batches which are summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. Following the DV review, the sample results subject to qualification for spike recoveries outside QC limits were flagged with "N" to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a potential low bias in the ability to recover the affected analyte in the given

sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP26457 Ω	JB53885-1	Antimony	35.6 %	34.1 %	NJ-	Low
MP26466 £	JB53885-31	Antimony	22.8 %	22.6 %	NJ-	Low

QC Limits are 75-125%;
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate.
 Ω – The samples associated with QC Batch MP26457 consist of JB53885-1 through -12 (inclusive), JB53885-25 through -30 (inclusive).
 £ – The samples associated with QC Batch MP26466 consist of JB53885-31 through -33, (inclusive), and JB53885-35 through -46 (inclusive).

The antimony results in all of these affected samples are qualified as estimated values and flagged with “NJ-” due to a potential low bias. These qualified results are presented below in summary table, Table 6, together with the results qualified for the serial dilution analysis results, as well as the field duplicate sample analysis.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate analysis was performed on two pairs of PPG soil samples and one non-client aqueous sample. All %RPD values were below the QC limit of 35%RPD, with values ranging 0.0 to 11.1%RPD for soil samples, and 0-17.1%RPD for the aqueous fraction. Thus, no results required qualification. The duplicate analyses demonstrated excellent analytical precision for the soil sample analysis.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 97.1% - 112.4% for the soil sample metals analysis in the two QC batches, and 103.8% to 113.5% for the batch containing the field blank (MP26464).

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative identified the serial dilution results being outside QC limits for nickel and vanadium in QC Batch MP26457 due to possible sample non-homogeneity. The case narrative also identified the serial dilution results (RPDs) as being outside QC limits in QC Batch MP26466 for chromium, nickel and vanadium and stated that the percent differences were acceptable due to low initial sample concentrations (<50 times IDL). However, inspection of the data revealed that the concentrations of all three of these analytes were actually above 50 × IDL and, therefore, above the 10%D QC limit in MP26466 and, therefore, subject to qualification as summarized below in Table 3. Thus, these affected results in the samples associated with this elevated %D exceedance are subject to qualification following the DV review, as discussed below.

Table 3. Serial Dilution Results Above QC Limits

QC Batch	QC Sample	Analyte	% Difference	DV Qualifier
MP26457 Ω	JB53885-1	Nickel	14.4 %D	EJ
MP26457 Ω	JB53885-1	Vanadium	10.8 %D	EJ

MP26466 £	JB53885-31	Chromium	13.2 %D	EJ
MP26466 £	JB53885-31	Nickel	13.0 %D	EJ
MP26466 £	JB53885-31	Vanadium	13.0 %D	EJ
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.				
Note –				
Ω – The samples associated with QC Batch MP26457 consist of JB53885-1 through -12 (inclusive), JB53885-25 through -30 (inclusive).				
£ – The samples associated with QC Batch MP26466 consist of JB53885-31 through -33 (inclusive), and JB53885-35 through -46 (inclusive).				

The associated nickel and vanadium in samples with laboratory sample ID numbers ranging JB53885-1 through -12 (inclusive) and JB53885-25 through -30, inclusive, and chromium, nickel, and vanadium results in samples with laboratory sample ID numbers ranging JB53885-31 through -33 (inclusive) and JB53885-35 through -46, inclusive, are qualified as estimated values and flagged with "EJ" to indicate that the result is an estimated value possibly experiencing variability in the reported value due to the presence of an interference in the sample matrix. The individual qualified results are presented in the summary table, Table 6, along with the results qualified for matrix spike recoveries and field duplicate analysis results outside QC limits.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

Three sets of field duplicate samples were collected as part of SDG JB53885. Field duplicate sample collection and analysis can provide a determination of sampling representativeness and precision. Gross differences between field sample duplicates can be an indication of inconsistent sampling techniques or sample matrix complexities/non-homogeneity.

The advisory data validation guidelines for field duplicate soil sample analysis vary. There is no NJDEP DV guideline for qualifying field duplicate results (NJDEP, 2002). Recently, EPA has recommended qualifying field duplicate results that differ by more than 50%RPD or $> 2 \times \text{CRQL}$ (USEPA, 2010), while the Field Sampling Plan for Hudson County chromium sites lists a data quality objective (DQO) of 50%RPD for soil samples (AECOM, 2010).

The results for the analysis of the three pairs of field duplicate samples are presented in Table 4, below. It is apparent that the results for the metals analytes that were detected in the field duplicate samples were very similar in two of the three pairs of samples analyzed and, thus, are considered representative, as the concentrations between field duplicate samples differed by less than 11 %RPD or differed by less than two times the reporting limit value ($< 2 \times \text{CRQL}$) for all analyte pairs, except for all five analytes in the field duplicate samples from KD002 5.5-6. Soil sample non-homogeneity may have contributed to the observed disparities.

Table 4. Comparison of Field Duplicate Soil Sample Results – SDG JB53885

Analyte	ID001 5-5.5 (mg/Kg)	DUP 22 (mg/Kg)	% RPD	DV Flag
Antimony	< 4.8 NJ-	< 4.3 NJ-	< 2 × CRQL	-
Chromium	16.1	17.5	8.3 %	-
Nickel	11.6 EJ	16.9 EJ	37.2 %	-
Thallium	< 2.4	< 2.2	< 2 × CRQL	-
Vanadium	19.5 EJ	20.7 EJ	6.0 %	-
Analyte	KD002 5.5-6 (mg/Kg)	DUP 23 (mg/Kg)	% RPD	DV Flag
Antimony	4.0 NJ-	< 0.99 NJ-	> 2 × CRQL	(J)
Chromium	802	44.6	178.9 %	J
Nickel	53.3 EJ	11.1 EJ	131.1 %	(J)
Thallium	< 2.0	< 0.49	> 2 × CRQL	J

Vanadium	82.4 EJ	7.6 EJ	166.2 %	(J)
Analyte	I1008 6-6.5 (mg/Kg)	DUP 21 (mg/Kg)	% RPD	DV Flag
Antimony	< 5.5 NJ-	< 4.3 NJ-	< 2 × CRQL	-
Chromium	16.7 EJ	17.3 EJ	3.5 %	-
Nickel	15.8 EJ	14.2 EJ	10.7 %	-
Thallium	< 2.8	< 2.1	< 2 × CRQL	-
Vanadium	21.1 EJ	21.9 EJ	3.7 %	-

< – The analyte was not detected at the stated reporting limit;
J – The reported result is an estimated value;
NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low;
EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.
(J) – Sample result is subject to DV qualification, but not additionally flagged with “J” to avoid redundancy;
CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit;
< 2 × CRQL – The difference between field duplicate results was less than two times the CRQL and meets QC requirements.

Consequently, due to the disparity in the five respective metals analyte results for the field duplicate samples K002 5.5-6 and DUP 23, these results are subject to qualification and are to be flagged with “J”, as indicated in Table 4 above. However, the antimony, nickel and vanadium results from these two field duplicates of KD002 5.5-6 and DUP23 are already qualified and flagged with either “NJ-” or “EJ”. Consequently, these affected sample results were not further flagged with an additional “J” in an effort to avoid redundancy in the applied qualifiers. However, the chromium and thallium results in KD002 5.5-6 and DUP23 are subject to qualification for the disparity in field duplicate sample concentrations and are flagged with “J” in Table 4, as well as the summary table, Table 6, below. Otherwise, the field duplicate results for the field duplicate samples from I1008 6-6.5 and ID001 5-5.5 demonstrated very good sampling representativeness and precision, with results generally less than 11%RPD.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The vanadium concentration for Sample KD002 3.5-4 (JB53885-11) was listed as 206 mg/Kg on the reporting form and 3.667 mg/L on the quantitation report in the raw data. However, according to the laboratory, the dilution factor (DF) is incorporated into a conversion factor by the instrument, such that the “raw” concentration measurement is already corrected for the dilution. The DF need

not be applied to the equation such that the value for DF in the equation below is 1 and not the actual DF value of 4. A calculation check provides the following result:

$$\text{Vanadium (mg/Kg)} = \frac{(3.667 \mu\text{g/L})(50 \text{ mL})(1)}{1000(\text{mL/L})(1.04 \text{ g})(85.6/100\%)} = 205.9557 \mu\text{g/g}$$

$$= 206 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 206 mg/Kg for Sample KD002 3.5-4 was correctly reported. This was the highest vanadium concentration detected among the soil samples of this SDG and exceeded the SRS of 78 mg/Kg.

Reporting Limits

The case narrative did identify that there were many analyte reporting limits that were elevated due to matrix interference. Review of the data indicated that there were a total of 25 of the 33 soil samples that had been diluted for analysis of metals at dilution factors of 5x, 4x, or 2x; however, all reporting limits were still below the respective SRS values, except for thallium in JB53885-33, as depicted below in Table 5.

The reporting limits for the target analytes determined for the ICP metals analysis employing the various assigned laboratory instruments all were below the respective site remediation standards; the exception was the instance where one sample was diluted by a factor of 5x, but the reporting limit was raised by a factor of 10, thereby raising the reporting limit for the thallium result above the respective SRS criterion, as detailed below in Table 5, diluted possibly due to anticipated matrix interference or sample/digestate appearance.

Table 5. Sample Reporting Limits Affected by Sample Dilution

Sample ID	Lab ID	Analyte	Reporting Limit (mg/Kg)	Dilution Factor	Adjusted Result	Remediation Standard
ID002 8.5-9	JB53885-33	Thallium	< 0.48	5	< 4.8	3
Units – mg/Kg < - The analyte was analyzed for, but was not detected above the stated reporting limit. NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.						

The results of the other analytes associated with the non-detect soil result of thallium in JB53885-33 were all below the respective SRS values, with low detected concentrations of nickel (11.3 mg/Kg) and vanadium (34.8 mg/Kg), including the low concentration of hexavalent chromium (3.4 mg/Kg), thereby suggesting a reasonably “clean” sample.

The interpretation of the thallium result (<4.8) in JB53885-33 was not significantly compromised by the applied dilution, because review of the data indicated the reason for the raising of the reporting limit was attributable to analyst judgement in including a safety factor (essentially doubling the 5x dilution to an effective value of 10x) to compensate for the presence of some interference in the sample data, rather than the presence of a detectable thallium concentration. Since the other target analytes in the sample were considerably below their respective SRS values, it is likely that the raw amount of thallium was similarly not elevated.

Summary

The soil sample analytical results for the samples of SDG JB53885 were found to be compliant with the analytical methods for the analysis of metals in the thirty-three soil samples and the field blank using SW-846 Method 6010C.

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony were outside QC limits of 75 - 125% for PPG samples JB53885-1 and -31 in the two QC batches. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity, such that antimony results in all soil samples of this SDG are qualified due to a potential low bias (NJ-).

Because there were differences between the field duplicate sample analyses that were greater than the respective QC limit, the chromium and thallium results in one set of field duplicate samples from KD002 5.5-6 are also qualified as estimated values and flagged with "J" in Table 6, presumably due to possible sample non-homogeneity or variability attributable to sample collection and or analytical precision.

The serial dilution results for nickel and vanadium in the QC sample of QC Batch MP26457 were above the QC limit of 10.0 %D, as were the chromium, nickel and vanadium results in MP26466, suggesting potential variability in the reported results due to the presence of interference in the matrix, such that the identified chromium, nickel and vanadium sample results are qualified as estimated values and are flagged with "EJ" in the samples identified below in Table 6.

Table 6. Summary of Qualified Sample Metals Results in SDG JB53885

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier

Key:

- < –The analyte was analyzed for, but was not detected above the stated reporting limit.
- J – The reported result is an estimated value.
- NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
- EJ – The reported value is estimated because of the presence of interference; indeterminate bias direction.

No other soil sample target metals results required qualification for any associated QC issues following the DV review.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in two QC batches for the soil samples and one for the field blank analysis.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|---------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | Field duplicate sample analysis |
| √ Quantitation checks | √ Data qualifiers |
| √ Data package completeness | |

Hexavalent chromium was detected in 27 of 33 soil samples analyzed in SDG JB53885 with detected concentrations of 14.3 or less, except for the two results of 605 and 279 mg/Kg in samples JB53885-11 and -25, respectively, such that two Cr+6 results had exceeded the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that all QC requirements were met, including the holding time, method blanks, and matrix spike recoveries. Although the soluble spike recovery for sample KD002 3.5-4 was outside QC limits (236.6%), the results are not subject to qualification because the sample concentration was more than four times the spike value (NJDEP, 2005).

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values exceeding 0.99985, values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 93.7% to 101.3% for the QC batches associated with the 33 soil samples, and 95.6% to 96.0% for the batch associated with the field blank, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L) or the field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

All matrix spike recoveries were within the QC limits of 75-125%, as well as post spike recoveries that were within the 85-115% QC limits, as presented below in Table 7, except for the soluble spike recovery for sample KD002 3.5-4. Although the soluble spike recovery (236.6%) for sample KD002 3.5-4 was outside QC limits, no further action needs to be taken by the laboratory and the results are not subject to qualification, because the sample concentration was more than four times the spike value (NJDEP, 2005). Thus, no hexavalent chromium results required qualification based on the results of the MS recoveries in the two batches of soil samples and one batch associated with the field blank of this SDG.

Table 7. Hexavalent Chromium Analysis Matrix Spike Recovery Results (JB53885)

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GN95459 ©	JB53790-1	Cr ⁺⁶ , soluble	100.0 %	----	----
GP76359 ‡	JB53885-11	Cr ⁺⁶ , soluble	¥ 236.6 %	----	----
GP76359 ‡	JB53885-11	Cr ⁺⁶ , insoluble	87.8 %	----	----
GP76359 ‡	JB53885-11	Cr ⁺⁶ , post-spike	94.3 %	----	----
GP76360 №	JB53885-41	Cr ⁺⁶ , soluble	97.6 %	----	----
GP76360 №	JB53885-41	Cr ⁺⁶ , insoluble	92.8 %	----	----
GP76360 №	JB53885-41	Cr ⁺⁶ , post-spike	94.5 %	----	----

QC Limits are 75-125% for MS recovery; 85-115% for post-spike recovery

MS – Matrix spike

Cr⁺⁶ – Hexavalent chromium

¥ – The sample concentration was > 4 × spike value; sample results not subject to qualification since spike may be masked.

© – The sample associated with QC Batch GN95459 consists of JB53885-34.

‡ – The samples associated with QC Batch GP76359 consist of JB53885-1 through -12 (inclusive), JB53885-35 through -40 (inclusive).

№ – The samples associated with QC Batch GP76360 consist of JB53885-25 through -33, (inclusive), and JB53885-41 through -46 (inclusive).

Duplicate Sample Analysis

The 19.9%RPD result for the duplicate Cr+6 analysis was the highest result observed in the general chemistry set of duplicate analyses, a value within laboratory QC limits, as well as the 35%RPD project QC limit for soil samples (AECOM, 2010). All other duplicate analyses met QC requirements with values of 0.0 %RPD for Cr+6 in the aqueous matrix and 2.9 to 19.9%RPD for the Cr+6, redox potential and pH analyses. Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries ranging 84.4% to 94.8%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in either of the two analytical sequences. Serial dilution analysis is not a requirement of the analytical method.

Field Duplicate Sample Analysis (QC Limit ≤ 50%RPD)

The results for the analysis of the three pairs of field duplicate samples are presented in Table 8, below.

Table 8. Comparison of Field Duplicate Soil Sample Results – SDG JB53885

Analyte	ID001 5-5.5 (mg/Kg)	DUP 22 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	0.48	1.1	< 2 × CRQL	-
Analyte	KD002 5.5-6 (mg/Kg)	DUP 23 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	279	< 0.45	> 2 × CRQL	J
Analyte	II008 6-6.5 (mg/Kg)	DUP 21 (mg/Kg)	% RPD	DV Flag
Hex.Chromium	< 0.45	5.7	> 2 × CRQL	J

QC Limit is ≤ 50 %RPD; < – The analyte was not detected at the stated reporting limit; J – The reported result is an estimated value; CRQL – The value representing the US EPA CLP contract required quantitation limit, often represented by the reporting limit; < $2 \times$ CRQL – The difference between field duplicate results was less than two times the reporting limit and meets QC requirements.

The results for the hexavalent chromium concentrations in the field duplicate samples from ID001 5-5.5 were similar and, thus, considered representative, as the concentrations between field duplicate samples differed by less than two times the reporting limit value ($< 2 \times$ CRQL). However, there appears to be great disparity between the field duplicate samples from KD002 5.5-6 and I1008 6-6.5 where the Cr+6 concentrations differed by more than twice the reporting limit ($> 2 \times$ CRQL) in these field duplicates.

As a result of the disparity in the respective hexavalent chromium results for the field duplicate samples from KD002 5.5-6 and I1008 6-6.5, these results are subject to qualification and are to be flagged with "J", as indicated in Table 8 above. Acceptable sampling representativeness and precision was demonstrated in one of the three pairs of field duplicate soil samples. The disparity between the remaining two sets of field duplicate samples may be attributable to soil sample non-homogeneity, failure to collect representative samples, or possible variability in the analytical precision which may act in concert to magnify the difference values. The qualified sample results for these field duplicate sample pairs are presented below in Table 9.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where:

- A = conc. from calib. curve (mg/L)
- B = Final digested volume (L)
- C = Wet wt of sample (Kg)
- D = % Solids/100
- E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample KD002 3.5-4 (JB53885-11) was listed as 605 mg/Kg on the reporting form and 0.2547 mg/L on the quantitation report in the raw data for a 50-fold diluted sample aliquot. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.2547 \text{ mg/L} \times 0.1 \text{ L} \times 50}{0.00246 \text{ Kg} \times 85.6/100} = \frac{1.2735}{0.0021058} = 604.7698 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 605 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 605 mg/Kg for Sample KD002 3.5-4 is correctly reported. This was the highest detected Cr⁺⁶ concentration detected among the 33 soil samples of this SDG, JB53885 and one of two Cr+6 concentration results above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No disparities relative to the reported values and characteristics were observed.

All but five of the 33 soil samples fell below the Eh/pH phase diagram line. These results suggest that almost all of the samples experience conditions of a “reducing” soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. Of these five samples experiencing oxidizing conditions, the highest detected Cr+6 concentrations were 605 mg/Kg in JB53885-11 and 279 mg/Kg in JB53885-25, while the remaining three samples presumed to be under “oxidizing” conditions were non-detect Cr+6 results. The corresponding total chromium results in the samples with Cr+6 concentrations above the SRS of 20 mg/Kg were 1240 and 802 mg/Kg, respectively. The remaining 28 soil samples of this SDG were under Eh/pH line denoting “reducing” conditions that are not favorable for oxidation to Cr+6 with concentrations of 14.3 mg/Kg or less.

Summary for Hexavalent Chromium Analysis

Since the MS recoveries were within QC limits, as were all other QC results associated with the hexavalent chromium analysis, including the duplicate sample analysis, no Cr⁺⁶ results were qualified following the DV review, except for select field duplicate results presented in Table 9.

Due to the differences between the Cr+6 results for the field duplicate samples from two locations being greater than the QC limit of > 2 × CRQL (or reporting limit), the affected Cr+6 results of both field duplicate pairs were qualified as estimated values and flagged with “J”, as presented in Table 9. No other Cr+6 results required qualification in SDG JB53885.

Table 9. Summary of Qualified Sample Cr⁺⁶ Results in SDG JB53885

Client ID	Laboratory Sample ID	Analyte	Result (mg/Kg)	DV Qualifier
KD002 5.5-6	JB53885-25	Cr+6	279	J
DUP 23	JB53885-28	Cr+6	< 0.45	J
II008 6-6.5	JB53885-37	Cr+6	< 0.45	J
DUP 21	JB53885-40	Cr+6	5.7	J
< – The analyte was analyzed for, but not detected at the specified reporting limit. J – The reported result is an estimated value.				

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
<	The compound was analyzed, but was not detected at the stated reporting limit.
J	The reported result is an estimated value.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
EJ	The reported value is estimated because of the presence of interference.

Hex chrome = JB 53885- 11 (50x); -25 (25x)

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

Thallium in JB 53885- 33

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

*Two nickel results : 53885- 11, 25
 Two vanadium results : 53885- 11, 25
 Two Cr⁶⁺ results : 53885- 11, 25*

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

*Refer to DV report discussions of case narrative regarding QC limit exceedances.
 No analytical problems with procedures were noted.*

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*

10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:

- 11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
- 12. Were the QC Summary Forms reviewed?..... Yes No
- 13. Internal Standards acceptable..... Yes No
- 14. MS/MSD acceptable..... Yes No
- 15. Calibration summaries acceptable..... Yes No
- 16. Serial dilutions acceptable..... Yes No
- 17. Inorganic duplicates acceptable..... Yes No
- 18. LCS recovery acceptable..... Yes No
- 19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 3, 4, and 8 for details.

Qualified sample results are presented in tables 6 and 9 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB53979/JB53979R
Sample Date: November 22, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: J. Giga. Ph.D., REP5554
Report Date: February 21, 2014

This data validation (DV) report presents the data review and result qualifications for seventeen (17) soil samples and one (1) field blank (FB) collected at the PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 22, 2013 for sample delivery group (SDG) JB53979. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB53979 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 17 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony (NJ-) in Samples JB53979-1 through -17 (inclusive);
- Hexavalent chromium (NJ-) in Samples JB53979-1 through -17 (inclusive);
- Hexavalent chromium (NJ-) in reanalyzed Samples JB53979-1R through -17R (inclusive)

No other sample results in SDG JB53979 required qualification. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for seven nickel, two vanadium and six hexavalent chromium (Cr+6) results. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

The sample results that were subject to qualification following the DV review are presented in Tables 3 and 6 of this DV report.

Sample Receipt

The seventeen (17) soil samples and one (1) field blank collected November 22, 2013 were received at the Accutest laboratory the same day on November 22, 2013 with acceptable sampling

cooler temperatures of 4°C. The field sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
JD004B 3-3.5	JB53979-1	11/22/13	Soil	Metals, Cr+6
JD004B 4-4.5	JB53979-2	11/22/13	Soil	Metals, Cr+6
KD005A 5-5.5	JB53979-3	11/22/13	Soil	Metals, Cr+6
KD005A 6-6.5	JB53979-4	11/22/13	Soil	Metals, Cr+6

FB 17	JB53979-18	11/22/13	Aqueous	Metals, Cr+6
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C.				
Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

Data Review

Data, as presented in the analytical data package SDG JB53979, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables

package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Several sample results exhibited concentrations above the respective site remediation standard (SRS) in some of the 17 soil samples of this SDG. These include seven nickel and two vanadium results that exceeded the SRS criteria of 31 mg/Kg and 78 mg/Kg, respectively.

Laboratory Case Narrative

The case narrative stated that the matrix spike (MS) and matrix spike duplicate (MSD) recoveries for antimony were identified as being outside QC limits in QC Batch MP76350 indicating possible matrix interference and/or sample non-homogeneity. The case narrative stated that the RPD for thallium in the serial dilution analysis was outside control limits, but the percent difference was acceptable due to low initial sample concentration (< 50 times IDL).

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

The QC calibration requirements were mostly met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for a few minor excursions.

The exceptions included the internal standard area count for IS#2 which is associated with chromium and vanadium in analytical run MA32772 for sample JB539789-7. However, this sample was reanalyzed with acceptable IS area counts. In this same analytical sequence, the 2 µg/L low-level calibration (CRI) standard for thallium recovered 150%, 0% and 170%, values outside the QC limits of 70-130%. However, the reporting limits for the non-detected thallium results in the

associated samples were generally approximately 1.0 mg/Kg, values above the corresponding "affected range" of 0-0.5 mg/Kg (true spike ± CRQL) and, therefore, not subject to qualification. Furthermore, the analysis of a low-level (CRI) standard is not a requirement of Method 6010C and, consequently, no DV procedure for qualifying this data. Additionally, the 160% thallium recovery for the CRID4 standard in MA32786 also did not affect the associated sample JB539789-7 because the non-detect result does not manifest a positive bias and therefore, also would not be subject to qualification.

Thallium was detected in a few CCBs of sequence MA32782 which was associated with only the field blank. The elevated CRI recoveries for thallium or antimony in this sequence also did not affect the field blank results because the non-detect results of the field blank are not affected by any potential positive bias suggested by the CRI standard or the associated CCB contamination.

Consequently, even though there were some minor issues with calibrations in this SDG, no associated sample results were affected or subject to qualification.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53979.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony in a non-client QC sample in QC Batch MP76350 for soil samples were below QC limits of 75-125% associated with all 17 soil samples, as summarized in Table 2 below. These recoveries indicate possible matrix interference and/or possible sample non-homogeneity. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP76530 Ω	JB53994-1A	Antimony	34.0 %	35.7 %	NJ-	Low
QC Limits are 75-125%; Post-digestion spike QC is 80-120% NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias. MS – Matrix spike MSD – Matrix spike duplicate Ω – The samples associated with QC Batch MP76350 consist of JB53979-1 through -17 (inclusive).						

Since none of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits, the sample results subject to qualification for low spike recoveries were flagged with "N" following the DV review to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a possible low bias in the ability to recovery

the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). These qualified results are presented below in summary table, Table 3.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate soil sample analysis was performed on one spiked duplicate sample from a non-client sample as a means of assessing the analytical precision. The concentrations for the target analytes were not unlike those frequently observed in PPG samples. The %RPD values ranged from 0.8 to 13.7 %RPD, values all well below the QC limit of 35%RPD for soil samples and the associated results did not require qualification. The duplicate and spike duplicate results in the QC batch associated with the field blank were also within the 20%RPD QC limits for aqueous samples. The duplicate analyses demonstrated excellent analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 86.4% - 101.8%.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative stated that the RPD for thallium in the serial dilution analysis was outside control limits, but the percent difference was acceptable due to low initial sample concentration (< 50 times IDL). All other results for the serial dilution analysis were within QC limits, thus, no sample results were qualified for any serial dilution issues.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported metals results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading (µg/L)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The vanadium concentration for Sample JD004B 3-3.5 (JB53979-1) was listed as 250 mg/Kg on the reporting form and 2.342 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Vanadium (mg/Kg)} &= \frac{(2.342 \mu\text{g/L})(100 \text{ mL})(1)}{1000(\text{mL/L})(1.03 \text{ g})(91.1\%/100\%)} = 249.5924 \mu\text{g/g} \\ &= 250 \text{ mg/Kg dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 250 mg/Kg for Sample JD004B 3-3.5 was correctly reported. This value is above the SRS of 78 mg/Kg. Vanadium was detected in one other sample above the SRS criterion.

Reporting Limits

No samples destined for metals analysis required dilution at the Accutest laboratory in Dayton, NJ, such that all reporting limits were below the respective SRS values.

Summary

The soil sample analytical results for the samples of SDG JB53979 were found to be compliant with the analytical methods for the analysis of metals in the seventeen soil samples using SW-846 Method 6010C.

The QC criteria were met for all ICP target analyte analyses, except for the low MS/MSD recoveries for antimony in the QC sample of QC Batch MP76350 which employed a non-client soil sample for the QC analysis. Sample results were qualified based on the results of the non-client QC samples because the sample concentrations were not unlike those observed in PPG soil samples. The soil samples collected November 22, 2013 are qualified as estimated values for antimony (flagged "NJ-") in the associated 17 soil samples due to a potential low bias, as indicated below in Table 3.

Table 3. Summary of Qualified Sample Metals Results in SDG JB53979

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
JD004B 3-3.5	JB53979-1	Antimony	< 2.1	NJ-
JD004B 4-4.5	JB53979-2	Antimony	< 2.1	NJ-
KD005A 5-5.5	JB53979-3	Antimony	< 2.4	NJ-
KD005A 6-6.5	JB53979-4	Antimony	< 2.5	NJ-
KD005A 7-7.5	JB53979-5	Antimony	< 2.2	NJ-
KD005A 8-8.5	JB53979-6	Antimony	< 2.3	NJ-
KD005A 9-9.5	JB53979-7	Antimony	< 2.3	NJ-
II009 0.5-1	JB53979-8	Antimony	< 2.3	NJ-
II009 2-2.5	JB53979-9	Antimony	< 2.3	NJ-
II009 4-4.5	JB53979-10	Antimony	< 2.2	NJ-
II009 6-6.5	JB53979-11	Antimony	< 2.2	NJ-
II009 8-8.5	JB53979-12	Antimony	< 2.4	NJ-
LD001A 2-2.5	JB53979-13	Antimony	< 2.1	NJ-
LD001A 3-3.5	JB53979-14	Antimony	< 2.2	NJ-
LD001A 4-4.5	JB53979-15	Antimony	< 2.4	NJ-
LD001A 5-5.5	JB53979-16	Antimony	< 2.4	NJ-
LD001A 6-6.5	JB53979-17	Antimony	< 2.0	NJ-

Key:
< –The analyte was analyzed for, but was not detected above the stated reporting limit.
NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the soil samples and one QC batch for the single field blank.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in twelve of the seventeen soil samples, with six concentrations exceeding the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that the QC requirements were met, including the holding time, method blanks, and matrix spike recoveries, except for the low soluble MS recovery in QC Batch GP76397, indicating possible matrix interference. The soluble MS recovery in QC Batch GP76397 was outside QC limits, but the insoluble spike and post-spike recoveries were acceptable.

Calibrations

The initial calibrations demonstrated an acceptable correlation coefficient with values all exceeding 0.99985 values greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 101.8% to 102.4% for the QC batch associated with the 17 soil samples, and were 100.1% for the QC batch associated with the field blank sample, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L), or the field blank. Thus, no sample results are affected or qualified for any potential QC blank contamination. Hexavalent chromium was not detected in the field blank at a reporting limit of 0.010 mg/L.

Matrix Spike Analysis

The matrix spike recoveries were within the QC limits of 75-125%, except for the soluble MS recovery for JB53979-7 in QC Batch GP76397. The low soluble matrix spike recovery for hexavalent chromium below the QC limits of 75-125% indicate possible matrix interference. The other matrix spike recoveries that were within the respective QC limits, are also presented in the summary table, Table 4.

Table 4. Matrix Spike Recovery Results

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76397 ¥	JB53979-7	Cr ⁺⁶ , soluble	54.5 %	NJ-	Low
GP76397 ¥	JB53979-7	Cr ⁺⁶ , insoluble	99.7 %	----	----
GP76397 ¥	JB53979-7	Cr ⁺⁶ , post spike	85.1 %	----	----

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 ¥ – The samples associated with QC Batch GP76397 consist of JB53979-1 through -17 (inclusive).

The soluble MS recovery of 54.5% was below QC limits for Cr⁺⁶ for the spiked sample from sampling location KD005A 9-9.5 in the soil sample analysis in QC Batch GP76397 which was associated with 17 soil samples with lab sample IDs of JB53979-1 through -17 (inclusive). In consideration of the DV guidelines that are based on SW-846 Method 7196A (NJDEP, 2005), the hexavalent chromium results for the associated seventeen soil samples are, consequently, qualified as estimated values and flagged with "NJ-" due to the potential low bias in the ability to recover this analyte in the soil matrix. These qualified results are presented below in Table 6.

Duplicate Sample Analysis

The duplicate analysis was performed on PPG sample JB53979-7. All %RPD values were below the QC limit of 35%RPD for soil samples, as well as the 20%RPD QC limit for aqueous samples and no results required qualification. The duplicate analyses had all RPD values below 4.4 %RPD, thereby demonstrating excellent analytical precision for the Cr+6, pH and redox potential analyses.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries between 100.5% and 101.1% for the soil sample analyses, and 100.0% for the analysis associated with the field blank, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No serial dilution analysis was performed in either of the two QC batches. This is not a required analysis of the analytical method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

- Where:
- A = conc. from calibration curve (mg/L)
 - B = Final digested volume (L)
 - C = Wet wt of sample (Kg)
 - D = % Solids/100
 - E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample LD001A 2-2.5 (JB53979-13) was listed as 104 mg/Kg on the reporting form and 0.4866 mg/L on the quantitation report in the raw data for a 5-fold dilution analysis. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.4866 \text{ mg/L} \times 0.1 \text{ L} \times 5}{0.00252 \text{ Kg} \times 92.8/100} = \frac{0.2433}{0.0023386} = 104.0384 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 104 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 104 mg/Kg for Sample LD001A 2-2.5 was correctly reported. This was the highest detected Cr+6 concentration detected among the 17 soil samples of this SDG, JB53979 analyzed for hexavalent chromium. This was one of six detected Cr+6 concentrations result above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No other disparities relative to the reported values and characteristics were observed. All results met the QC limits, such that no pH or redox potential (ORP) results are subject to qualification.

Six of the 17 soil samples were above the Eh/pH phase diagram line. These results suggest that most of the samples experience conditions of a "reducing" soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. Of the six samples experiencing "oxidizing" conditions, the highest detected Cr+6 concentration was 104 mg/Kg in JB53979-13; the total chromium result from its ICP analysis was 345 mg/Kg. Of the five remaining sample Cr+6 results above the Eh-pH line, three exhibited a Cr+6 result above the SRS with corresponding total chromium values ranging from 345 to 2030 mg/Kg Cr. Two of these samples above the Eh/pH line had Cr+6 concentrations less than 12 mg/Kg and total chromium values of less than 19 mg/Kg. Consequently, the positioning of a sample above the Eh/pH line does not always stipulate that an excess of Cr+6 will be present in a sample.

Summary of Cr+6 Results in SDG JB53979

Due to the low MS recovery for the soluble spike in QC Batch GP76397, the Cr⁺⁶ results in the associated 17 soil samples are qualified as estimated values and flagged with "NJ-" due to a potential low bias in the ability to recover Cr+6 from the given soil matrix. No other Cr+6 results were subject to qualification in the hexavalent chromium analyses, or the pH, redox potential or total solids analyses. The Cr+6 results qualified due to low Cr⁺⁶ spike recoveries in the soluble MS analysis following the DV review are presented in Table 6 near the end of this DV report in a comparison to results from their reanalysis.

Because the soluble MS recovery values were below QC limits in QC batch GP76397, the samples required reanalysis where the resultant data are presented in SDG JB53979R and summarized in this report in sections below under the subsection labeled "SDG JB53979R".

SDG JB53979R

Because the soluble MS recovery in the initial soil sample analysis for hexavalent chromium was below the QC limit of 75% for the spike recovery associated with the 17 soil samples, the 17 soil samples of SDG JB53979 were reanalyzed for hexavalent chromium. The soil samples numbered JB53979-1R through -17R were re-analyzed and the data submitted in a supplemental data package labeled JB53979R (R for reanalysis). The samples were re-prepped and analyzed on December 6, 2013 for Cr⁺⁶, within the 30-holding time for soil samples. The samples present in SDG JB53979R are identified in Table 1, but are labeled with the suffix 'R' in the laboratory sample ID number such as JB53979-7R for the reanalysis of client ID sample KD005A 9-9.5, which was

the sample used as the QC sample in SDG JB53979R. Hexavalent chromium was detected in 13 of the 17 soil samples reanalyzed with five Cr+6 results above the SRS of 20 mg/Kg.

The case narrative of SDG JB53979R indicated that the QC requirements were met for the reanalysis of the soil samples of SDG JB53979R, except that the soluble MS recovery was outside QC limits in the QC batch, as presented in Table 5 below.

Calibrations

The initial calibration for the QC batches in the analytical sequence of 12/5/13 demonstrated an acceptable correlation coefficient with the value of 0.99984, a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 95.0% to 96.6% for the QC batch associated with the 17 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blank (< 0.40 mg/Kg), or any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike (MS) recovery for the soluble matrix spike was below QC limits in the re-analysis of JB53979-7R from soil sampling location KD005A 9-9.5, as noted in Table 5. Thus, the hexavalent chromium results for samples with laboratory sample ID numbers JB53979-1R through -17R (inclusive) are still subject to qualification to be flagged with "NJ-".

Table 5. Matrix Spike Recovery Results in SDG JB53979R

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76499 ϕ	JB53979-7R	Cr ⁺⁶ , soluble	6.7 %	NJ-	Low
GP76499 ϕ	JB53979-7R	Cr ⁺⁶ , insoluble	90.7 %	----	----
GP76499 ϕ	JB53979-7R	Cr ⁺⁶ , post spike	85 %	----	----

QC Limits are 75-125% for MS Recovery; 85-115% for post spike recovery.
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 ϕ – The samples associated with QC Batch GP76499 consist of JB53979-1R through -17R (inclusive).

The soluble MS recovery of 6.7% was below QC limits for Cr⁺⁶ for the spiked sample from sampling location KD005A 9-9.5 in the soil sample analysis in QC Batch GP76499 which was associated with 17 soil samples with lab sample IDs of JB53979-1R through -17R (inclusive). Despite the 6.7% soluble MS recovery, the results were not rejected, but qualified as estimated values flagged with "NJ-", because the insoluble MS recovery was within QC limits, an approach found acceptable by Mr. Joseph Sanguiliano of the NJDEP.

These qualified Cr+6 results from the reanalysis are presented alongside those of the initial analysis in Table 6. The comparison indicates that the results from the re-analysis are remarkably comparable to those of the initial analysis.

Duplicate Sample Analysis

One soil sample was analyzed in duplicate with a difference of 15.9%RPD, a value less than the DV QC limit of 35%RPD, thereby demonstrating excellent analytical precision.

Laboratory Control Sample (LCS) Analysis

The LCS recoveries were acceptable and within QC limits of 80-120%, with recoveries of ranging from 90.0% and 92.4%, thereby demonstrating acceptable analytical system performance.

Sample Result Verification

The detected hexavalent chromium concentration for Sample LD001A 2-2.5 (JB53979-13R) was listed as 102 mg/Kg on the reporting form and 0.4775 mg/L on the quantitation report in the raw data for a 5-fold dilution analysis. A calculation check provides the following result:

$$Cr^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$Cr^{+6} \text{ (mg/Kg)} = \frac{0.4775 \text{ mg/L} \times 0.1 \text{ L} \times 5}{0.00253 \text{ Kg} \times 92.8/100} = \frac{0.23875}{0.0023478} = 101.6892 \text{ mg/Kg}$$

$$Cr^{+6} \text{ (mg/Kg)} = 102 \text{ mg/Kg}$$

After rounding to 3 significant figures, this verifies that the hexavalent chromium concentration of 102 mg/Kg for Sample LD001A 2-2.5 was correctly reported.

Summary for Hexavalent Chromium Analysis

The soil sample results from the initial analysis are presented alongside those obtained from the reanalysis of samples in SDG JB53979 below in Table 6. The Cr+6 results of the reanalysis appear to be comparable to those of the initial analysis, both associated with low MS recoveries and possibly suggesting a potential low bias in the ability to recover this analyte in the given sample matrix.

Table 6. Comparison of Qualified Sample Cr⁺⁶ Results in SDGs JB53979 and JB53979R

Client ID	Lab Sample ID	Analyte	JB53979 Result (mg/Kg)	DV Qualifier	JB53979R Result (mg/Kg)	DV Qualifier
JD004B 3-3.5	JB53979-1	Cr+6	82.7	NJ-	69.6	NJ-
JD004B 4-4.5	JB53979-2	Cr+6	3.7	NJ-	4.1	NJ-
KD005A 5-5.5	JB53979-3	Cr+6	28.5	NJ-	26.6	NJ-
KD005A 6-6.5	JB53979-4	Cr+6	10.0	NJ-	11.0	NJ-
KD005A 7-7.5	JB53979-5	Cr+6	< 0.45	NJ-	0.59	NJ-
KD005A 8-8.5	JB53979-6	Cr+6	< 0.46	NJ-	< 0.46	NJ-
KD005A 9-9.5	JB53979-7	Cr+6	0.90	NJ-	0.81	NJ-
II009 0.5-1	JB53979-8	Cr+6	6.1	NJ-	7.2	NJ-
II009 2-2.5	JB53979-9	Cr+6	0.76	NJ-	1.2	NJ-
II009 4-4.5	JB53979-10	Cr+6	24.4	NJ-	27.2	NJ-
II009 6-6.5	JB53979-11	Cr+6	< 0.46	NJ-	< 0.46	NJ-
II009 8-8.5	JB53979-12	Cr+6	< 0.46	NJ-	< 0.46	NJ-
LD001A 2-2.5	JB53979-13	Cr+6	104	NJ-	102	NJ-
LD001A 3-3.5	JB53979-14	Cr+6	99.4	NJ-	20.1	NJ-
LD001A 4-4.5	JB53979-15	Cr+6	23.1	NJ-	14.6	NJ-
LD001A 5-5.5	JB53979-16	Cr+6	6.1	NJ-	4.1	NJ-
LD001A 6-6.5	JB53979-17	Cr+6	< 0.52	NJ-	< 0.52	NJ-

< – The analyte was analyzed for, but not detected at the specified reporting limit.

NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is below QC limits; potential low bias.

Review of Table 6 indicates that the Cr+6 results from both the initial and the re-analysis are remarkably comparable, even considering the potential for disparities attributable to soil sample non-homogeneity. The only significant disparity seems to be between the Cr+6 results for sample JB53979-14, LD001A 3-3.5.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 53979

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times
(for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.
- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

3 samples were diluted because Cr⁺⁶ result was above calibration range. (5x)
JB 53979 - 1, 13, 14.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Seven nickel : JB 53979 - 1, 3, 4, 10, 13, 14, 15

two vanadium : JB 53979 - 1, 10

Six Cr⁺⁶ : JB 53979 - 1, 3, 10, 13, 14, 15 Five Reanalysis Cr⁺⁶
JB 53979 - 1R, 3R, 10R, 13R, 14R

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding AR limit exceedances.

No problems with analytical procedures were noted.

8. Were qualified data used?..... Yes No
9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. *Not applicable*
10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 For Hex Chrome, data were rejected because spike recovery was <50%.
 Data were rejected due to missing deliverables.
 Data were rejected but an applicable standard exceedance exists.
 Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
12. Were the QC Summary Forms reviewed?..... Yes No
13. Internal Standards acceptable..... Yes No
14. MS/MSD acceptable..... Yes No
15. Calibration summaries acceptable..... Yes No
16. Serial dilutions acceptable..... Yes No
17. Inorganic duplicates acceptable..... Yes No
18. LCS recovery acceptable..... Yes No
19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 4, and 5 for details.

Qualified sample results are presented in Tables 3 and 6 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDG JB53997
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Mercury, EPA Method 7471B
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Faiza M. Botros
Janis V. Giga, Ph.D., REP5554
Date: March 4, 2014

This data validation (DV) report presents the data review and result qualifications for one (1) solid sample (referred to as "nodules") collected at the Jersey City PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on November 22, 2013 for sample delivery group (SDG) JB53997. The sample was analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey.

Summary of Sample Results Qualifications

The solid (nodules) sample analytical results for the sample of SDG JB53997 were found to be compliant with the analytical method (SW-846 Method 6010C) for the analysis of metals in the one collected solid sample, as well as mercury (7471B) and hexavalent chromium (7196A).

Following the detailed DV review, the following sample results were qualified:

- Antimony, copper, iron, and lead (NJ-) in Sample JB53997-1;
- Mercury (NJ+) in Sample JB53997-1.

The hexavalent chromium (Cr⁺⁶) and mercury results in the solid sample did not require qualification, since all QC requirements were met for these analyses.

The qualified sample results that were subject to qualification following the DV review are presented in Table 3. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

Sample Receipt

The one (1) solid sample collected on November 22, 2013, was received November 22, 2013 at the Accutest laboratory in Dayton, NJ with acceptable sampling cooler temperatures of 4°C. The field sample identification number and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

Client Sample Designation	Sample Lab ID Number	Date Collected	Matrix	Analyses
107 NODULES	JB53997-1	11/22/13	Solid	Metals, Hg, Cr ⁺⁶
Metals – 22 target metals analyzed by EPA SW-846 Method 6010C at Accutest Laboratories in Dayton, NJ Cr ⁺⁶ – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential; Hg - Mercury analysis using EPA SW-846 Method 7471B.				

Data Review

Data, as presented in the analytical data package SDG JB53997, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods), SOP No. 5.A.16* (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP), SOP HW-2, Revision XIII* (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial Dilution |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The solid ("nodules") sample was analyzed for 22 target EPA Method 6010C metals, mercury using EPA Method 7471B, as well as percent total solids. The site remediation standards (SRS) of 31 mg/Kg for nickel, 78 mg/Kg for vanadium, and 20 mg/Kg for hexavalent chromium were exceeded in the solid sample of this SDG. Since the only sample of this SDG was not diluted, all reporting limits were below the respective SRS criteria values.

Laboratory Case Narrative

The following items were mentioned in the Case Narrative of this SDG (JB53997) data package for the metals analyses:

The matrix spike and matrix spike duplicate recoveries for antimony, copper, iron and lead for non-client QC sample JB53994-1 in QC Batch MP762350 were outside control limits indicating possible matrix interference and/or sample non-homogeneity. Although the MS/MSD recoveries for calcium, magnesium and zinc were outside control limits, the spike amounts were low relative to sample concentrations. The RPD for zinc was outside (laboratory) QC limits for the spiked duplicate sample indicating possible sample non-homogeneity.

The case narrative listed the following metals as exceeding the QC limit in the serial dilution analysis of the QC sample: selenium, silver, sodium, and thallium. However, the percent difference results were acceptable due to low initial sample concentration (< 50 times IDL).

The matrix spike recovery of the mercury analysis was outside control limits, indicating possible matrix interference. The case narrative stated that the RPD for mercury was outside control limits for the MSD. This statement actually referred to the RPD value of the spiked duplicate in the mercury analysis. However, the RPD value of 29.8 %RPD is still below the QC limit for, duplicate analysis of 35%RPD for solid matrix samples. All other QC requirements were met during the mercury analysis.

These issues are detailed in the discussion below.

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for the inductively coupled argon plasma (ICP) spectrometer analysis, as well as the 28-day holding time for mercury analysis.

Calibration Standards (QC Limits 90-110%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the solid sample analyses and acceptable analyte quantitation (concentration determination), except for the recoveries identified below.

The exceptions included three calibration check standard recoveries in analytical run MA32772 for thallium. The recoveries (150%, 0%, and 170%) were outside QC limits for CRI standards (70-

130%), but did not significantly affect the reported results. The "CRI" standard recoveries associated with JB53997 did not affect the thallium results because the reporting limit for the non-detect thallium result in the sample (< 1.2 mg/Kg) was above the affected range of approximately 0-0.46 mg/Kg and, thus, associated results are not subject to qualification.

A low 86.8% magnesium recovery in this analytical sequence did not affect PPG sample results, since this CCV standard was not associated with sample JB53997-1, because the sample analysis was bracketed by two acceptable CCV recoveries. Thus, no qualification of sample results associated with calibration issues is warranted.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank or the continuing calibration blanks at the stated reporting limits, such that no solid sample results warranted qualification for any associated QC blank contamination in SDG JB53997.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The matrix spike and matrix spike duplicate (MS/MSD) recoveries for antimony, copper, iron, and lead were below the DV QC limits for a non-client soil sample JB53994-1A in QC Batch MP76350, as presented in Table 2. The case narrative identified calcium, magnesium, and zinc as having MS/MSD recoveries outside QC limits. However, the initial sample concentrations were more than four times the spike amount (> 4 × spike) and consequently, the sample results are not subject to qualification due to potential masking of the recoveries by the elevated sample concentrations (USEPA, 2010; NJDEP, 2002). The antimony, copper, iron, and lead matrix spike recoveries indicate possible matrix interference and/or possible sample non-homogeneity. None of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits to indicate the possible presence of a possible bias in the ability to recovery the particular analyte in the given sample matrix. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP76350 Ω	JB53994-1A	Antimony	34.0 %	35.7 %	NJ-	Low
MP76350 Ω	JB53994-1A	Copper	30.5 %	17.3 %	NJ-	Low
MP76350 Ω	JB53994-1A	Iron	74.2 %	108.4 %	NJ-	Low
MP76350 Ω	JB53994-1A	Lead	- 24.1 %	- 22.0 %	NJ-	Low
MP76437 †	JB53999-2A	Mercury	207.4 %	402.4 %	NJ+	High

Data validation QC Limits are 75-125%;
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias;
 NJ+ – The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias;
 MS – Matrix spike;
 MSD – Matrix spike duplicate;
 Ω – The sample associated with QC Batch MP76398 consists of JB53997-1.
 † – The sample associated with QC Batch MP76437 consists of JB53997-1.

The recoveries of antimony, copper, iron, and lead in the MS/MSD samples in the QC batch are associated with the solid ("nodules") sample of this SDG, as presented in Table 3 below. Based on the DV guidelines available for SW-846 inorganic analyte analysis (NJDEP, 2002), the antimony, copper, iron, and lead results in the associated sample (JB53997-1) were flagged with "N" to indicate that the sample result is associated with a matrix spike recovery outside QC limits. The sample results are further qualified as estimated values and flagged with "J-" following the DV evaluation for a possible low bias in the ability to recover these four analytes in the associated solid sample, as presented below in Table 3. Even though the lead recovery was a negative value, the associated sample result was qualified as an estimated value because lead was detected in the sample. Had the lead result been a non-detect result, consideration would have been given to rejection, although there is no lower limit for MS recoveries that would recommend rejection of a sample result (NJDEP, 2002).

All remaining matrix spike recoveries for the target analytes were within QC limits of 75-125%, indicating acceptable analytical accuracy for this SDG.

Duplicate analysis (QC Limit \leq 35 %RPD)

A spiked duplicate analysis was performed on a non-client sample (JB53994-1A) for the QC batch associated with the solid sample of this SDG, such that analytical precision could be evaluated. The difference between the spiked duplicate sample were below the laboratory QC limit of 20%RPD reported by the laboratory, for all analytes, except zinc (24.15%RPD), as well as below the 35%RPD QC limit recommended in DV guidelines (USEPA, 2010). Since the RPD values between the spiked duplicate recoveries ranged from 0%RPD to 13.7%RPD, excluding the zinc value, the results demonstrate acceptable analytical precision for this analysis

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 86.4% - 118.8%.

Serial Dilution Analysis (QC Limit \leq 10 %D)

The case narrative stated that the serial dilution results for selenium, silver, sodium, and thallium were outside control limits, but that the percent difference (%D) results were acceptable due to low initial sample concentration ($<$ 50 times IDL). Consequently, no sample results warranted qualification for serial dilution analysis results.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported vanadium results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

where: C = Raw instrument reading ($\mu\text{g/L}$)
V = final volume (mL)
DF = Dilution factor
W = wet weight (g)
TS = Total solids (%)
1000 = conversion factor (mL/L)

The vanadium concentration for Sample 107 NODULES (JB53997-1) was listed as 124 mg/Kg on the reporting form and 1.073 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Vanadium (mg/Kg)} = \frac{(1.073 \mu\text{g/L})(100 \text{ mL})(1)}{1000(\text{mL/L})(0.97 \text{ g})(89.2\%/100\%)} = 124.0118 \mu\text{g/g}$$

$$= 124 \text{ mg/Kg, dry weight}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 124 mg/Kg for Sample "107 NODULES" was correctly reported.

Mercury

Sample mercury concentrations reported on the Form 1 sheets were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the validation activity. The soil mercury results appear to be correctly reported.

The following equation was used to verify the reporting of mercury results in solid samples:

$$\text{Mercury (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times \text{TS}/100\%}$$

where: C = Raw instrument reading (μg/L)
 V = final volume (mL)
 DF = Dilution factor
 W = wet weight (g)
 TS = Total solids (%)

The mercury result for Sample "107 NODULES" (JB53997-1) was listed as 0.066 mg/Kg on the reporting form (Form I) and 0.3866 mg/L on the quant report. A calculation check provides the following result for the detected mercury result:

$$\text{Mercury (mg/Kg)} = \frac{(0.3866 \mu\text{g/L})(100 \text{ mL})(1)}{1000(\text{mL/L})(0.6544 \text{ g})(89.2\%/100\%)}$$

$$= \frac{38.66}{583.725} = 0.0662298 \mu\text{g/g}$$

$$= 0.06623 \text{ mg/Kg dry weight, which is rounded to a reported result of } 0.066 \text{ mg/Kg}$$

The reported detected mercury concentration of 0.066 mg/Kg for Sample "107 NODULES" was thereby verified by this calculation check.

Summary of Metals Results

The sample analytical results for the solid ("nodules") sample of SDG JB53997 were found to be compliant with the analytical methods for the analysis of metals in the solid sample using SW-846 Method 6010C. QC criteria were met for all ICP target analyte analyses, except for the low matrix

spike recoveries for antimony, copper, iron, and lead in the QC sample and the elevated MS recovery for mercury that was above QC limits. The antimony, copper, iron, and lead results are qualified as estimated values and flagged with "NJ-" in JB53997-1 due to a possible low bias in the ability to recover these four analytes, while the mercury results are qualified as estimated values and flagged with "NJ+" due to possible positive (high) bias in the ability to recover mercury from a solid sample matrix, as presented below in Table 3.

Table 3. Summary of Qualified "Nodules" Soil Sample Results in SDG JB53997

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
107 NODULES	JB53997-1	Antimony	< 2.3	NJ-
107 NODULES	JB53997-1	Copper	22.8	NJ-
107 NODULES	JB53997-1	Iron	24,500	NJ-
107 NODULES	JB53997-1	Lead	15.1	NJ-
107 NODULES	JB53997-1	Mercury	0.066	NJ+

Key:
 < – The analyte was analyzed for, but was not detected at the stated reporting limit.
 NJ- - The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias;
 NJ+ - The matrix spike recovery was above QC limits; associated sample results may experience a potential high bias.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The sample was analyzed in one QC batch for the soil sample.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | √ Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected at 457 mg/Kg in this solid ("nodules") sample analyzed in SDG JB53997. This Cr⁺⁶ result had exceeded the SRS of 20 mg/Kg in this one (1) solid sample.

Case Narrative

The case narrative indicated that the QC requirements were met for issues such as holding time, method blank, blank spike recoveries and the %RPDs of the duplicate control samples. The matrix spike recovery for the insoluble Cr⁺⁶ was within the QC limits. However, the matrix spike recovery of the soluble Cr⁺⁶ was high (135%), due low spike amount relative to the sample concentration. All other QC requirements were met for the associated samples.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient of 0.9999; a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered both at 103.3% in the QC batch GP76398, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in any of the method blanks (< 0.40 mg/Kg), any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike recovery for the insoluble Cr⁺⁶ was within the QC limits of 75-125%, as well as post-spike recoveries that were within the 85-115% QC limits. However, the matrix spike recovery for the soluble Cr⁺⁶, as presented below in Table 4, was above the QC limits. However, the associated sample results are not subject to qualification, because the initial sample Cr+6 concentration was more than four times the spike amount (NJDEP, 2005). The elevated MS recovery may be attributable to masking of the spike by the large initial sample concentration. Thus, no hexavalent chromium results required qualification based on the results of the MS recoveries.

Table 4. Hexavalent Chromium Analysis Matrix Spike Recovery Results – SDG JB53997

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76398 Ω	JB53997-1	Cr ⁺⁶ , soluble	135.4 %	----	***
GP76398 Ω	JB53997-1	Cr ⁺⁶ , insoluble	96.5 %	----	----
GP76398 Ω	JB53997-1	Cr ⁺⁶ , post-digestion spike	95.4%	----	----

QC Limits are 75-125% (soil) for MS recovery; 85-115% for post spike recovery.
MS – Matrix spike
Cr⁺⁶ – Hexavalent chromium
*** – Sample concentration > 4× spike amount; sample results not subject to qualification;
Ω – The sample associated with QC Batch MP76398 consists of JB53997-1.

Duplicate Sample Analysis

The duplicate analysis was performed on one set of duplicate samples. The %RPD value for the QC batch GP76398 was within the QC limits of 35%RPD for soil samples (USEPA, 2010; AECOM, 2010). Thus, no hexavalent chromium results warranted qualification in this SDG for any duplicate analysis issues

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits; with recoveries ranging 93.9% to 97.3%, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No sample Cr⁺⁶ results were qualified for serial dilution analysis results, as it appears that a serial dilution analysis was not performed in the analytical sequence. Serial dilution is not a requirement of the analytical method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calibration curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample 107 NODULES (JB53997-1) was listed as 457 mg/Kg on the reporting form and 0.3941 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.3914 \text{ mg/L} \times 0.1 \text{ L} \times 25}{0.00240 \text{ Kg} \times 89.2/100} = \frac{0.9785}{0.00214} = 457.24 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 457 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 457 mg/Kg for Sample 107 NODULES was correctly reported. Thus, this detected Cr⁺⁶ concentration result was above the SRS of 20 mg/Kg. Please note that this sample required a 1:25 dilution in order for the response to fall within the calibration range of the instrument.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh result was verified and found to be represented correctly on the Eh/pH phase diagram. No disparities relative to the reported value and characteristic was observed.

This sample was observed to fall below the Eh-pH phase diagram line. This result suggests that sample 107 NODULES experiences a condition of reducing soil environment. Thus, the hexavalent chromium result is considered acceptable as reported with the hexavalent chromium concentration of 457 mg/Kg was above the SRS of 20 mg/Kg.

Summary for Hexavalent Chromium Analysis

The 135% soluble matrix spike recovery value for Cr⁺⁶ was above the QC limits (75-125%). This high matrix spike recovery is due to the low spike amount relative to the sample concentration. However, the associated sample results are not subject to qualification, because the initial sample Cr⁺⁶ concentration was more than four times the spike amount (NJDEP, 2005). The elevated MS recovery may be attributable to masking of the spike by the large initial sample concentration.

All other QC results associated with the hexavalent chromium analysis were within QC limits. Consequently, sample results were not impacted and no qualification was needed for the Cr+6 results in SDG JB53997.

3.0 Data Qualifier Definitions

The absence of qualifiers indicates that the reported sample results are acceptable both qualitatively and quantitatively.

Qualifier	Description
<	The compound was analyzed, but was not detected at the stated reporting limit.
J	The result is an estimated value.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
E	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB53997

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times (for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.
- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Nickel and vanadium in JB53997-1.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

*Refer to DV report discussions of case narrative regarding QC limit exceedances.
No analytical procedural problems were noted.*

8. Were qualified data used?..... Yes No

9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Not applicable

10. Were rejected data used?..... Yes No

If "yes", please indicate reasons rejected data were used:

- For Hex Chrome, data were rejected because spike recovery was <50%.
- Data were rejected due to missing deliverables.
- Data were rejected but an applicable standard exceedance exists.
- Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
- Other reasons not noted directly above. Explain:

11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No

12. Were the QC Summary Forms reviewed?..... Yes No

13. Internal Standards acceptable..... Yes No

14. MS/MSD acceptable..... Yes No

15. Calibration summaries acceptable..... Yes No

16. Serial dilutions acceptable..... Yes No

17. Inorganic duplicates acceptable..... Yes No

18. LCS recovery acceptable..... Yes No

19. Other QC acceptable?..... Yes No

Provide a brief explanation, if applicable.

Refer to DV report table 2 for details.

Qualified sample results are presented in Table 3 of the DV report.

DATA VALIDATION REPORT

Project: Jersey City PPG, Site 107; Report SDGs JB54625/JB54625R/JB54625RT
Sample Date: December 2 and 3, 2013
Analyses: Metals Analysis, EPA Method 6010C
Hexavalent Chromium Analysis, EPA Method 3060A/7196A
Redox Potential, ASTM D1498-76M
pH, EPA Method 9045C,D
Percent Solids, SM2540 G-97
Reviewer: Janis V. Giga. Ph.D., REP5554
Report Date: February 23, 2014

This data validation (DV) report presents the data review and result qualifications for seventeen (17) soil samples collected at the PPG Site 107 (18 Chapel Avenue) in Jersey City, New Jersey on December 2 and 3, 2013 for sample delivery group (SDG) JB54625. The samples were analyzed for the analytes listed above employing the identified analytical methods by Accutest Laboratories of Dayton, New Jersey.

Summary of Sample Results Qualifications

The soil sample analytical results for the samples of SDG JB54625 were found to be compliant with the analytical methods employed for the analysis of metals and hexavalent chromium (Cr⁺⁶) in the 17 collected soil samples and one field blank.

Following the detailed DV review, the following sample results were qualified:

- Antimony, chromium, and thallium (NJ-) in Samples JB54625-1 through -17 (inclusive);
- Hexavalent chromium (NJ-) in Samples JB54625-1 through -17 (inclusive);
- Hexavalent chromium (NJ-) in reanalyzed Samples JB54625-1R through -17R (inclusive)

No other sample results in SDG JB54625 required qualification. Details are provided in the tables and text below. The reported concentrations were below the respective site remediation standard (SRS) limits, except for twelve nickel, three vanadium and five hexavalent chromium (Cr⁺⁶) results. A data validation checklist is provided in Attachment A to summarize the observations during the DV review.

The sample results that were subject to qualification following the DV review are presented in Tables 3 and 6 of this DV report.

Sample Receipt

The seventeen (17) soil samples collected December 2 and 3, 2013 were received at the Accutest laboratory on December 3, 2013 with acceptable sampling cooler temperatures of 1°C. The field

sample identification numbers and corresponding laboratory identification numbers are as follows:

Table 1. Sample Receipt Summary

<u>Client Sample Designation</u>	<u>Sample Lab ID Number</u>	<u>Date Collected</u>	<u>Matrix</u>	<u>Analyses</u>
ED015 0"-6"	JB54625-1	12/2/13	Soil	Metals, Cr+6
ED015 2-2.5	JB54625-2	12/2/13	Soil	Metals, Cr+6
ED015 8-8.5	JB54625-3	12/2/13	Soil	Metals, Cr+6
ED013 8-8.5	JB54625-4	12/2/13	Soil	Metals, Cr+6
ED013 10-10.5	JB54625-5	12/2/13	Soil	Metals, Cr+6
ED013 14-14.5	JB54625-6	12/2/13	Soil	Metals, Cr+6
GD011 0.5-1	JB54625-7	12/3/13	Soil	Metals, Cr+6
GD011 2-2.5	JB54625-8	12/3/13	Soil	Metals, Cr+6

ED008 6-6.5	JB54625-15	12/3/13	Soil	Metals, Cr+6
ED008 7-7.5	JB54625-16	12/3/13	Soil	Metals, Cr+6
ED008 8-8.5	JB54625-17	12/3/13	Soil	Metals, Cr+6
Metals – Antimony, chromium, nickel, thallium and vanadium analyzed by SW-846 Method 6010C.				
Cr+6 – Hexavalent chromium analyzed by SW-846 Method 7196A at Accutest Laboratories in Dayton, NJ together with pH and redox potential.				

Data Review

Data, as presented in the analytical data package SDG JB54625, was primarily reviewed and validated using the following combination of method-specific criteria with professional judgement, as appropriate:

- New Jersey Department of Environmental Protection (NJDEP) *Standard Operating Procedure: Quality Assurance Data Validation of Analytical Deliverables Inorganics (Based on USEPA SW-846 Methods)*, SOP No. 5.A.16 (NJDEP, 2002);
- United States (US) Environmental Protection Agency (EPA) “*National Functional Guidelines for Inorganic Data Review*”, OSWER Publication 9240.1-51, EPA540-R-10-011, January 2010 (US EPA, 2010);
- *Evaluation of Metals Data for the Contract Laboratory Program (CLP)*, SOP HW-2, Revision XIII (USEPA, 2006).
- NJDEP *Standard Operating Procedure (SOP) for Analytical Data Validation of Hexavalent Chromium* (NJDEP, 2005);

Data associated with parameters that do not meet quality control (QC) specifications or compliance requirements, have been qualified in accordance with US EPA Region II/NJDEP specifications/guidelines, as appropriate.

The analysis of the identified samples was performed in compliance with the requirements specified in the respective analytical methods. The data package in a NJDEP full deliverables package is considered complete, as presented. The information presented in the data summary

and quality control (QC) verification forms was supported by the raw data. The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

The discussion below presents the findings of the data validation review organized according to the technical areas used to evaluate inorganic analytical data. For each of these analytical topics, the information on the summary forms, as well as the raw data and supporting information for each sample or standard analyzed were reviewed during the DV effort.

1.0 Metals Analysis Data Review

The data validation of the metals analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements:

- | | |
|---------------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Serial dilution analysis |
| √ ICP Interference Check Sample | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

The soil samples were analyzed for five target EPA Method 6010C metals (antimony, total chromium, nickel, thallium, and vanadium), as well as percent total solids. Several sample results exhibited concentrations above the respective site remediation standard (SRS) in some of the 17 soil samples of this SDG. These include twelve nickel and three vanadium results that exceeded the SRS criteria of 31 mg/Kg and 78 mg/Kg, respectively.

Laboratory Case Narrative

The case narrative stated that the matrix spike (MS) recovery for antimony, and the matrix spike duplicate (MSD) recoveries for antimony, chromium and thallium were identified as being outside QC limits in QC Batch MP76525 indicating possible matrix interference and/or sample non-homogeneity. The case narrative stated that the RPD for antimony and thallium in the serial dilution analysis were outside control limits, but the percent difference was acceptable due to low initial sample concentration (< 50 times IDL).

Holding times (QC Limit 6 months)

The six-month analytical holding time was met for all ICP samples.

Calibration Standards (QC Limits 90-110%; CRI QC Limit 70-130%)

All QC calibration requirements were met by the initial and continuing calibrations employed, including those of the "low calibration check standard" ("CRI" standard), with target analyte recoveries all within the respective required QC limits, thereby demonstrating linearity for the soil sample analyses and acceptable analyte quantitation (concentration determination), except for the thallium detected in some continuing calibration blanks (CCBs) identified below in MA32866 and MA32880 and the low CRDL standard recovery for thallium and an elevated recovery for antimony in analytical sequence MA32884.

Thallium was detected in two CCBs of analytical sequence MA32866 as well as one CCB of MA32880. However, the samples analyzed in sequence MA32866 exhibited only non-detect thallium results and the samples were bracketed by CCBs with non-detect thallium results, such that the samples were not associated with the CCBs exhibiting the detected thallium results. The PPG samples of JB54625 analyzed in sequence MA32880 were analyzed for thallium, but the

affected samples were not associated with the CCB exhibiting the detected thallium concentration. Thus, no thallium results were subject to qualification for this CCB issue.

The CRDL standard (CRID3) recovery for thallium was 0%, a value below the DV QC limits of 70-130%. There were three PPG samples analyzed in the affected sequence, JB54625-1, -2, and -3. Since thallium was not detected in these three samples and the reporting limit of approximately < 1.0 mg/Kg was above the estimated affected range of 0-0.4 mg/Kg, the thallium results are not subject to qualification. In addition, antimony in CRID2 recovered 133%. Since antimony was not detected in any of the three associated samples, with a reporting limit above the affected range (true ± CRQL) as well, the antimony results were not subject to qualification (USEPA, 2010).

Hence, no soil sample results warranted qualification for any calibration issues.

Quality Control Blanks (QC Limit < CRDL or <RL)

There were no target metals concentrations detected in the procedure blank, the continuing calibration blanks, or the field blank at the stated reporting limits, such that no soil sample results warranted qualification for any associated QC blank contamination in SDG JB53979.

ICP Interference Check Samples (QC Limits 80-120%)

All analyte recoveries in the interference check samples, both IND A and IND B, were within the specified QC limits for the target compounds.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis
(QC Limits 75-125% Recovery; ≤ 35%RPD)

The MS recovery for antimony, and the MSD recoveries for antimony, chromium and thallium were identified as being outside QC limits in QC Batch MP76525, indicating possible matrix interference and/or sample non-homogeneity. The matrix spike recoveries below QC limits are presented in Table 2. The remaining matrix spike results fell within QC limits.

Table 2. Matrix Spike Recovery Results Outside QC Limits

QC Batch	QC Sample	Analyte	MS Recovery	MSD Recovery	DV Qualifier	Potential Bias
MP76525 Ω	JB54625-1	Antimony	40.5 %	35.0 %	NJ-	Low
MP76525 Ω	JB54625-1	Chromium	95.5 %	73.6 %	NJ-	Low
MP76525 Ω	JB54625-1	Thallium	77.0 %	74.4 %	NJ-	Low

QC Limits are 75-125%; Post-digestion spike QC is 80-120%
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 MSD – Matrix spike duplicate
 Ω – The samples associated with QC Batch MP76525 consist of JB54625-1 through -17 (inclusive);

Since none of the associated results had been flagged with the laboratory 'N' flag, as is customary in reporting metals results associated with matrix spike recoveries outside QC limits, the sample results subject to qualification for low spike recoveries were flagged with "N" following the DV review to indicate that the result is associated with QC recovery outside QC limits and further flagged with "J-" to indicate the possible presence of a possible low bias in the ability to recover the antimony in the given sample matrix, in accordance with DV guidelines (USEPA, 2010; NJDEP, 2002). These qualified results are presented below in summary table, Table 3.

Duplicate analysis (QC Limit ≤ 35 %RPD)

The duplicate soil sample analysis was performed on one spiked duplicate sample from PPG sample JB54625-1 in an attempt to assess the analytical precision. The %RPD values ranged from 5.5 to 16.5 %RPD, values all well below the QC limit of 35%RPD for soil samples and the associated results did not require qualification. The duplicate analyses demonstrated acceptable analytical precision.

Laboratory control samples (QC Limits 80-120% Recovery)

All analyte recoveries in the laboratory control samples were within the specified QC limits demonstrating acceptable analytical system performance, with recoveries ranging 80.6% - 87.6%.

Serial Dilution Analysis (QC Limit ≤ 10 %D)

The case narrative stated that the RPDs for antimony and thallium in the serial dilution analysis were outside control limits, but the percent difference was acceptable due to low initial sample concentration (< 50 times IDL). All other results for the serial dilution analysis were within QC limits, thus, no sample results were qualified for any serial dilution issues.

Quantification Verification

Sample metals concentrations reported on the Form 1 sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported vanadium results:

$$\text{Vanadium (mg/Kg)} = \frac{C \times V \times DF}{1000 \times W \times TS/100\%}$$

- where: C = Raw instrument reading (µg/L)
- V = final volume (mL)
- DF = Dilution factor
- W = wet weight (g)
- TS = Total solids (%)
- 1000 = conversion factor (mL/L)

The vanadium concentration for Sample ED015 8-8.5 (JB54625-3) was listed as 78.0 mg/Kg on the reporting form, a value equal to the SRS criterion for vanadium in soils, and 0.7813 mg/L on the quantitation report in the raw data. A calculation check provides the following result:

$$\begin{aligned} \text{Vanadium (mg/Kg)} &= \frac{(781.3 \mu\text{g/L})(100 \text{ mL}) (1)}{1000(\text{mL/L}) (1.47 \text{ g}) (68.1\%/100\%)} = 78.0465 \mu\text{g/g} \\ &= 78.0 \text{ mg/Kg dry weight} \end{aligned}$$

After rounding to three significant figures, this verifies that the vanadium concentration of 78.0 mg/Kg for Sample ED015 8-8.5 was correctly reported. This value is equal to the SRS of 78 mg/Kg. Vanadium was detected in two other samples above the SRS criterion.

Reporting Limits

No samples destined for metals analysis required dilution at the Accutest laboratory in Dayton, NJ, such that all reporting limits were below the respective SRS values.

Summary

The soil sample analytical results for the samples of SDG JB54625 were found to be compliant with the analytical methods for the analysis of metals in the seventeen soil samples using SW-846 Method 6010C.

The QC criteria were met for all ICP target analyte analyses, except for the low MS recovery for antimony and the low MSD recoveries for antimony, chromium and thallium in the QC sample JB54625-1 of QC Batch MP76525. Sample results were qualified based on the results of the QC sample such that the 17 soil samples collected December 2 and 3, 2013 are qualified as estimated values for antimony, chromium and thallium (flagged "NJ-") in the associated 17 soil samples due to a potential low bias, as indicated below in Table 3.

Table 3. Summary of Qualified Sample Metals Results in SDG JB54625

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
ED015 0"-6"	JB54625-1	Antimony	< 2.3	NJ-
ED015 0"-6"	JB54625-1	Chromium	31.2	NJ-
ED015 0"-6"	JB54625-1	Thallium	< 1.1	NJ-

ED010 7-7.5	JB54625-13	Antimony	< 2.0	NJ-

Sample ID	Lab ID	Analyte	Result (mg/Kg)	DV Qualifier
ED010 7-7.5	JB54625-13	Chromium	748	NJ-
ED010 7-7.5	JB54625-13	Thallium	< 1.0 †	NJ-
ED008 5-5.5	JB54625-14	Antimony	4.4	NJ-
ED008 5-5.5	JB54625-14	Chromium	1800	NJ-
ED008 5-5.5	JB54625-14	Thallium	< 1.2	NJ-
ED008 6-6.5	JB54625-15	Antimony	< 2.4	NJ-
ED008 6-6.5	JB54625-15	Chromium	62.3	NJ-
ED008 6-6.5	JB54625-15	Thallium	< 1.2	NJ-
ED008 7-7.5	JB54625-16	Antimony	< 2.0	NJ-
ED008 7-7.5	JB54625-16	Chromium	72.4	NJ-
ED008 7-7.5	JB54625-16	Thallium	< 0.98	NJ-
ED008 8-8.5	JB54625-17	Antimony	< 2.0	NJ-
ED008 8-8.5	JB54625-17	Chromium	62.3	NJ-
ED008 8-8.5	JB54625-17	Thallium	< 1.0	NJ-

Key:

< –The analyte was analyzed for, but was not detected above the stated reporting limit.

NJ- – The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.

No other soil sample target metals results required any qualification for any associated QC issues.

2.0 Hexavalent Chromium Analysis Data Review

The analysis for hexavalent chromium (Cr⁺⁶) was performed using US EPA Method 3060A for sample preparation and Method 7196A for soil sample analysis. The samples were analyzed in one QC batch for the soil samples.

The data validation of the analytical data was reviewed for the following data quality items and a check mark (√) indicates successful achievement of meeting the relevant QC requirements.

- | | |
|-----------------------------|------------------------------|
| √ Holding times | Matrix spike recoveries |
| √ Blank Analysis | √ Duplicate analysis |
| √ Calibration standards | √ Laboratory control samples |
| √ Calibration verification | √ Quantitation checks |
| √ Data package completeness | √ Data qualifiers |

Hexavalent chromium was detected in fourteen of the 17 soil samples, with five concentrations exceeding the SRS of 20 mg/Kg.

Case Narrative

The case narrative indicated that the QC requirements were met, including the holding time, method blanks, and matrix spike recoveries, except for the low soluble MS recovery in QC Batch GP76615. The RPD for the duplicate analysis in QC Batch GP76615 was outside QC limits, but the RPD was acceptable due to low duplicate and sample concentration.

Calibrations

The initial calibration demonstrated an acceptable correlation coefficient with a value exceeding 0.99982, a value greater than the calibration requirement for linearity of 0.995. Calibration check

standards recovered in the range of 95.4% to 96.1% for the QC batch associated with the 17 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blanks (< 0.40 mg/Kg) or any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike recoveries were within the QC limits of 75-125%, except for the soluble MS recovery for JB54625-1 in QC Batch GP76615 that was marginally below the QC limit range. The low soluble MS recovery for hexavalent chromium below the QC limits of 75-125% indicates possible matrix interference. The other matrix spike recoveries that were within the respective QC limits, are also presented in the summary table, Table 4.

Table 4. Matrix Spike Recovery Results for Cr+6 in SDG JB54625

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76615 ¥	JB54625-1	Cr ⁺⁶ , soluble	72.1 %	NJ-	Low
GP76615 ¥	JB54625-1	Cr ⁺⁶ , insoluble	85.0 %	----	----
GP76615 ¥	JB54625-1	Cr ⁺⁶ , post spike	98.2 %	----	----

QC Limits are 75-125% for MS recovery; 85-115% for post spike recovery
 NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
 MS – Matrix spike
 ¥ – The samples associated with QC Batch GP76615 consist of JB54625-1 through -17 (inclusive).

The soluble MS recovery of 72.1% was marginally below QC limits for Cr⁺⁶ for the spiked sample from sampling location ED015 0"-6" in the soil sample analysis in QC Batch GP76615 which was associated with 17 soil samples with lab sample IDs of JB54625-1 through -17 (inclusive). In consideration of the DV guidelines that are based on SW-846 Method 7196A (NJDEP, 2005), the hexavalent chromium results for the associated seventeen soil samples are, consequently, qualified as estimated values and flagged with "NJ-" due to the potential low bias in the ability to recover this analyte in the soil matrix. These qualified results are presented below in Table 6.

Duplicate Sample Analysis

The duplicate analysis was performed on PPG sample JB54625-1. All %RPD values were below the QC limit of 35%RPD for soil samples. The duplicate analysis demonstrated acceptable analytical precision with an RPD value of 26.1%RPD, as well as < 2 x CRQL, for Cr+6 and less than 0.4 %RPD for pH and redox potential, thereby demonstrating excellent analytical precision for the Cr+6, pH and redox potential analysis.

Laboratory Control Sample Analysis

The recoveries in the laboratory control samples (LCSs), also referred to as blank spikes, recovered within the 80-120% QC limits, with recoveries between 80.3% and 97.0% for the soil sample analyses, thereby demonstrating acceptable analytical system performance.

Serial Dilution Analysis

No serial dilution analysis was performed in either of the two QC batches. This is not a required analysis of the analytical method.

Sample Result Verification

Sample Cr⁺⁶ concentrations reported on the Form 1 (Report of Analysis) sheets for the samples were verified from the raw quantitation reports in the raw data and adjusted for percent solids during the data validation review activity. The following equation was used to verify reported Cr⁺⁶ results:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

Where: A = conc. from calib. curve (mg/L)
 B = Final digested volume (L)
 C = Wet wt of sample (Kg)
 D = % Solids/100
 E = Dilution (if necessary)

The detected hexavalent chromium concentration for Sample ED008 8-8.5 (JB54625-17) was listed as 75.1 mg/Kg on the reporting form and 0.7961 mg/L on the quantitation report in the raw data for a 2-fold dilution analysis. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.7961 \text{ mg/L} \times 0.1 \text{ L} \times 2}{0.00258 \text{ Kg} \times 82.2/100} = \frac{0.15922}{0.0021208} = 75.07686 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 75.1 \text{ mg/Kg}$$

After rounding to three significant figures, this verifies that the hexavalent chromium concentration of 75.1 mg/Kg for Sample ED008 8-8.5 was correctly reported. This was the highest detected Cr+6 concentration detected among the 17 soil samples of this SDG, JB54625 analyzed for hexavalent chromium. This was one of five detected Cr+6 concentrations result above the SRS of 20 mg/Kg.

pH/Eh (ORP)

The calibrations for pH analysis were acceptable and the QC requirements were met for duplicate analysis. Standard mV solution checks for Eh analysis were acceptable and within the QC ranges, as were the duplicate sample analyses. The reported pH and Eh results were randomly verified and found to be represented correctly on the Eh/pH phase diagrams. No other disparities relative to the reported values and characteristics were observed. All results met the QC limits, such that no pH or redox potential (ORP) results are subject to qualification.

Each of the 17 soil samples were below the Eh/pH phase diagram line. These results suggest that all of the samples experience conditions of a "reducing" soil environment where the oxidation to Cr+6 is not favorable and observed concentrations of Cr+6 are not expected to increase. Of the five samples exceeding the SRS value, the highest detected Cr+6 concentration was 75.1 mg/Kg in JB54625-17; the total chromium result from its ICP analysis was only 62.3 mg/Kg, thereby limiting subsequent oxidation to Cr+6.

Summary of Cr+6 Results in SDG JB54625

Due to the low MS recovery for the soluble spike in QC Batch GP76615, the Cr⁺⁶ results in the associated 17 soil samples are qualified as estimated values and flagged with "NJ-" due to a potential low bias in the ability to recover Cr+6 from the given soil matrix. No other results were subject to qualification in the hexavalent chromium analyses for other issues, nor were the pH, redox potential or total solids results qualified. The Cr+6 results qualified due to low Cr⁺⁶ spike recoveries in the soluble MS analysis following the DV review are presented in Table 6 near the end of this DV report and compared to results from their reanalysis.

Because the soluble MS recovery values were below QC limits in QC batch GP76615, the samples required reanalysis where the resultant data are presented in SDG JB54625R and summarized in this report in sections below under the subsection labeled "SDG JB54625R".

SDG JB54625R

As a result of the soluble MS recovery in the initial soil sample analysis for hexavalent chromium being below the QC limit of 75% for the spike recovery associated with 17 soil samples, the 17 soil samples of SDG JB54625 were reanalyzed for hexavalent chromium. The soil samples numbered JB54625-1R through -17R were re-analyzed and the data submitted in a supplemental data package labeled JB54625R (R for reanalysis). The samples were re-prepped December 26, 2013 and analyzed on December 29, 2013 for Cr⁺⁶, within the 30-holding time for soil samples. The samples present in SDG JB54625R are identified in Table 1, but are labeled with the suffix 'R' in the laboratory sample ID number such as JB54625-1R for the reanalysis of client ID sample ED015 0"-6", which was the sample used as the QC sample in SDG JB54625. Hexavalent chromium was detected in 14 of the 17 soil samples reanalyzed with four Cr+6 results above the SRS of 20 mg/Kg.

The case narrative of SDG JB54625R indicated that the QC requirements were met for the reanalysis of the soil samples of SDG JB54625R, except that the soluble MS recovery was outside QC limits in the QC batch, as presented in Table 5 below.

Calibrations

The initial calibration for the QC batches in the analytical sequence of 12/2913 demonstrated an acceptable correlation coefficient with the value of 0.99981, a value greater than the calibration requirement for linearity of 0.995. Calibration check standards recovered in the range of 99.3% to 100.3% for the QC batch associated with the 17 soil samples, all meeting the continuing calibration QC requirement of 90-110%.

Quality Control Blanks

Hexavalent chromium was not detected in either the method blank (< 0.40 mg/Kg), or any of the continuing calibration blanks (< 0.010 mg/L). Thus, no sample results are affected or qualified for any potential QC blank contamination.

Matrix Spike Analysis

The matrix spike (MS) recovery for the soluble matrix spike was below QC limits in the re-analysis of JB54625-1R from soil sampling location ED015 0"-6", as noted in Table 5. Thus, the hexavalent chromium results for samples with laboratory sample ID numbers JB54625-1R through -17R (inclusive) are still subject to qualification as estimated values and to be flagged with "NJ-", due to the potential low bias in the ability to recover Cr+6 from the given soil matrix.

Table 5. Matrix Spike Recovery Results in SDG JB54625R

QC Batch	QC Sample	Analyte	MS Recovery	DV Qualifier	Potential Bias
GP76896 ϕ	JB54625-1R	Cr ⁺⁶ , soluble	63.6 %	NJ-	Low
GP76896 ϕ	JB54625-1R	Cr ⁺⁶ , insoluble	82.9 %	----	----
GP76896 ϕ	JB54625-1R	Cr ⁺⁶ , post spike	92.7 %	----	----

QC Limits are 75-125% for MS Recovery; 85-115% for post spike recovery.
NJ- – The matrix spike recovery was below QC limits; associated sample results may experience a potential low bias.
MS – Matrix spike
 ϕ – The samples associated with QC Batch GP76896 consist of JB54625-1R through -17R (inclusive).

The soluble MS recovery of 63.67% was below QC limits for Cr⁺⁶ for the spiked sample from sampling location ED015 0"-6" in the soil sample analysis in QC Batch GP76896 which was associated with 17 soil samples with lab sample IDs of JB54625-1R through -17R (inclusive).

These qualified Cr+6 results from the reanalysis are presented alongside those of the initial analysis in Table 6. The comparison indicates that the results from the re-analysis are remarkably comparable to those of the initial analysis.

Duplicate Sample Analysis

One soil sample was analyzed in duplicate with a difference of 6.8%RPD, a value less than the DV QC limit of 35%RPD, thereby demonstrating excellent analytical precision.

Laboratory Control Sample (LCS) Analysis

The LCS recoveries were acceptable and within QC limits of 80-120%, with recoveries of ranging from 94.8% and 111.2%, thereby demonstrating acceptable analytical system performance.

Sample Result Verification

The detected hexavalent chromium concentration for Sample ED008 5-5.5 (JB54625-14R) was listed as 69.5 mg/Kg on the reporting form and 0.2913 mg/L on the quantitation report in the raw data for a 5-fold dilution analysis. A calculation check provides the following result:

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{A \times B \times E}{C \times D}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = \frac{0.2913 \text{ mg/L} \times 0.1 \text{ L} \times 5}{0.00244 \text{ Kg} \times 85.9/100} = \frac{0.14565}{0.002096} = 69.4908 \text{ mg/Kg}$$

$$\text{Cr}^{+6} \text{ (mg/Kg)} = 69.5 \text{ mg/Kg}$$

After rounding to 3 significant figures, this verifies that the hexavalent chromium concentration of 69.5 mg/Kg for Sample ED008 5-5.5 was correctly reported.

SDG JB546235RT

The reducing conditions in the soil matrix appear supported by the TOC, S⁻ screen and Fe⁺² data. The associated QC results for the blank spike, duplicate analysis and the MS results were all within the specified QC limits demonstrating acceptable accuracy and precision.

The supporting analyses (ferrous iron, sulfide screen, and TOC) were analyzed on Sample JB54625-1RT (ED015 0"-6"), a sample which was analyzed twice without detecting a concentration of Cr+6 above 1.0 mg/Kg. The three supporting parameters were analyzed outside the respective holding times in order to provide more information about the possible impact of the sample matrix on the Cr+6 recoveries. Professional judgement was applied in not qualifying these results for the holding time exceedances. According to the method, these analyses should be performed on the sample experiencing the low spike recoveries; the soluble MS recoveries for this QC sample were 72.1% and 63.6% for the reanalysis (JB54625-1R).

The detected ferrous iron (1.4%) and TOC concentration (215,000 mg/Kg) results in JB54625-1RT are at comparable levels with samples in the research literature identified as exhibiting "reducing" soil conditions (Brose and James, 2013; Jardine, et al., 1999; Jardine, et al., 2013), as also indicated on the Eh-pH phase diagram. Thus, the results of the supplemental analyses support the soil conditions being of a "reducing" environment. The "reducing" conditions in the soil matrix of a soil sample falling below the Eh-pH phase line are thereby supported by the TOC, Fe⁺² and Eh-pH data.

Summary for Hexavalent Chromium Analysis

The soil sample results from the initial analysis are presented alongside those obtained from the reanalysis of samples in SDG JB54625 below in Table 6. The Cr+6 results of the reanalysis appear to be comparable to those of the initial analysis, both associated with low MS recoveries and possibly suggesting a potential low bias in the ability to recover this analyte in the given sample matrix.

Table 6. Comparison of Qualified Sample Cr⁺⁶ Results in SDGs JB54625 and JB54625R

Client ID	Lab Sample ID	Analyte	JB54625 Result (mg/Kg)	DV Qualifier	JB54625R Result (mg/Kg)	DV Qualifier
ED015 0"-6"	JB54625-1	Cr+6	1.0	NJ-	0.85	NJ-
ED015 2-2.5	JB54625-2	Cr+6	3.6	NJ-	1.5	NJ-
ED015 8-8.5	JB54625-3	Cr+6	21.7	NJ-	18.2	NJ-
ED013 8-8.5	JB54625-4	Cr+6	< 0.61	NJ-	< 0.61	NJ-

< – The analyte was analyzed for, but not detected at the specified reporting limit. NJ- – Indicates an estimated value associated with a matrix spike sample recovery that is below QC limits; potential low bias.						

Review of Table 6 indicates that the Cr+6 results from both the initial and the re-analysis are, again, remarkably comparable, even considering the potential for disparities attributable to soil sample non-homogeneity.

3.0 DATA QUALIFIER DEFINITIONS

The absence of qualifiers indicates that the data are acceptable both qualitatively and quantitatively.

Qualifier	Definition
J	The reported result is an estimated value.
<	The compound was analyzed, but was not detected at the stated reporting limit.
N	The matrix spike sample recovery in the associated QC sample is not within QC limits.
NJ+	The matrix spike sample recovery in the associated QC sample is above QC limits; the result may be biased high.
NJ-	The matrix spike sample recovery in the associated QC sample is below QC limits; the result may be biased low.
*	Duplicate analysis not within control limits; indeterminate bias direction.
EJ	The reported value is estimated because of the presence of interference.

ATTACHMENT A
Data Validation Checklist

DATA QUALITY ASSURANCE/QUALITY CONTROL CHECKLIST

Project PPG SDG JB 54625

- 1. Were the appropriate sample preservation requirements met?..... Yes No
- 2. Were appropriate sample holding times
(for both extraction/sample preparation and analysis) met? Yes No
If "No", provide a brief explanation.

- 3. Were the samples diluted? Yes No
Indicate the identity of the samples and why.

JB 54625-17 was diluted by 2x for the analysis of Cr⁺⁶ because the concentration was greater than the calibration range.

- 4. If applicable, did sample dilutions result in elevated reporting limits that exceed applicable standards?..... Yes No
If "Yes", list the affected samples.

- 5. Were any applicable standards exceeded for any samples? Yes No
If "Yes", include the number of samples and laboratory sample ID numbers.

Twelve nickel : JB 54625- 2, 3, 4, 5, 6, 9, 10, 13, 14, 15, 16, 17.

Three vanadium : JB 54625- 3, 6, 9.

Five Cr⁺⁶ : JB 54625- 3, 11, 13, 14, 17.

- 6. Were the laboratory reporting limits below the applicable remediation standards/criteria required for the site?..... Yes No
If "No", provide a brief explanation of action taken.

- 7. Were qualifications noted in the non-conformance summary?..... Yes No
Provide a brief explanation.

Refer to DV report discussions of case narrative regarding QC limit exceedances.

No analytical procedural problems were noted.

- 8. Were qualified data used?..... Yes No
- 9. Were rejections noted in the non-conformance summary?..... Yes No
Provide a brief explanation. NA
- 10. Were rejected data used?..... Yes No
If "yes", please indicate reasons rejected data were used:
 - For Hex Chrome, data were rejected because spike recovery was <50%.
 - Data were rejected due to missing deliverables.
 - Data were rejected but an applicable standard exceedance exists.
 - Data were rejected in an early phase of remediation; however, additional sampling and analysis are scheduled to be performed.
 - Other reasons not noted directly above. Explain:

- 11. Were the quality control criteria associated with the compounds of concern at the site met? Yes No
- 12. Were the QC Summary Forms reviewed?..... Yes No
- 13. Internal Standards acceptable..... Yes No
- 14. MS/MSD acceptable..... Yes No
- 15. Calibration summaries acceptable..... Yes No
- 16. Serial dilutions acceptable..... Yes No
- 17. Inorganic duplicates acceptable..... Yes No
- 18. LCS recovery acceptable..... Yes No
- 19. Other QC acceptable?..... Yes No
Provide a brief explanation, if applicable.

Refer to DV report tables 2, 4 and 5 for details.

Qualified sample results are presented in tables 3 and 6 of the DV report.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDG #JC68303

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30412R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC68303 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180619)	JC68303-1	Water	6/19/2018		X	X	X
SW-D10(0.0-0.5)	JC68303-2	Soil	6/19/2018		X	X	X
SW-D10(2.0-2.5)	JC68303-3	Soil	6/19/2018		X	X	X
SW-D10(4.0-4.5)	JC68303-4	Soil	6/19/2018		X	X	X
SW-D10(6.0-6.5)	JC68303-5	Soil	6/19/2018		X	X	X
SW-D10(8.0-8.5)	JC68303-6	Soil	6/19/2018		X	X	X
SW-D10(10.0-10.5)	JC68303-7	Soil	6/19/2018		X	X	X
DUP-1(20180619)	JC68303-8	Soil	6/19/2018	SW-D10(4.0-4.5)	X	X	X
SW-D9(0.0-0.5)	JC68303-9	Soil	6/19/2018		X	X	X
SW-D9(2.0-2.5)	JC68303-10	Soil	6/19/2018		X	X	X
SW-D9(4.0-4.5)	JC68303-11	Soil	6/19/2018		X	X	X
SW-D9(6.0-6.5)	JC68303-12	Soil	6/19/2018		X	X	X
SW-D9(8.0-8.5)	JC68303-13	Soil	6/19/2018		X	X	X
SW-D9(10.0-10.5)	JC68303-14	Soil	6/19/2018		X	X	X
SW-D4(0.0-0.5)	JC68303-15	Soil	6/19/2018		X	X	X
SW-D4(2.0-2.5)	JC68303-16	Soil	6/19/2018		X	X	X
SW-D4(4.0-4.5)	JC68303-17	Soil	6/19/2018		X	X	X
SW-D4(6.0-6.5)	JC68303-18	Soil	6/19/2018		X	X	X
SW-D4(8.0-8.5)	JC68303-19	Soil	6/19/2018		X	X	X
SW-D4(10.0-10.5)	JC68303-20	Soil	6/19/2018		X	X	X
DUP-2(20180619)	JC68303-21	Soil	6/19/2018	SW-D4(0.0-0.5)	X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X

7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130%.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample locations SW-D10(4.0-4.5) and SW-D9(2.0-2.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-D10(4.0-4.5)	Antimony	56.4%	58.4%
SW-D9(2.0-2.5)	Antimony	56.4%	58.4%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using samples SW-D10(4.0-4.5) and SW-D9(2.0-2.5). The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D10(4.0-4.5) / DUP-1(20180619)	Chromium	18.4	21 U	AC
	Vanadium	24.0	25.1	
	Nickel	12.8	26.8	NC
SW-D4(0.0-0.5) / DUP-2(20180619)	Nickel	19.8	19.9	AC
	Chromium	17.1	13.7	22.1%
	Vanadium	43.4	41.6	4.2%

Notes:

AC = Acceptable

NC = Non-compliant

The nickel results associated with samples locations SW-D10(4.0-4.5) and DUP-1(20180619) were not in agreement. The associated sample results were qualified as estimated.

The differences in the results between the parent sample SW-D4(0.0-0.5) and field duplicate sample DUP-2(20180619) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample locations SW-D10(4.0-4.5) and SW-D9(2.0-2.5) exhibited %D within control limits, with the exception of the analytes presented in the following table.

DATA REVIEW REPORT

Sample Locations	Analytes	Serial Dilution (%D)
SW-D10(4.0-4.5)	Chromium	13.5%
SW-D9(2.0-2.5)	Chromium	11.5%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below. The qualifications are applied to all sample results associated with the sample preparation batch.

Control Limit	Sample Result	Qualification
> 10%	Non-detect	UJ
	Detect	J

8. System Performance and Overall Assessment

The chromium and thallium results in sample DUP-1(20180619) were reported as non-detected at an elevated reporting limit of 21mg/kg. The sample required dilution due to an interfering element.

The thallium result in sample SW-D4(6.0-6.5) was reported as non-detected at an elevated reporting limit of 11mg/kg. The sample required dilution due to an interfering element.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample location SW-D10(4.0-4.5) in association with the insoluble hexavalent chromium analysis exhibited a recovery within the control limits.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-D10(4.0-4.5)	Hexavalent Chromium, Soluble	67.1%	64.2%
SW-D9(2.0-2.5)	Hexavalent Chromium, Soluble	< 50%	< 50%
	Hexavalent Chromium, Insoluble	59.2%	< 50%

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

The PDS analysis performed on sample location SW-D10(4.0-4.5) exhibited a recovery within the control limits.

Spike recoveries were outside of the control limits as presented in the table below.

DATA REVIEW REPORT

Sample Location	Analyte	Initial PDS Recovery	Reanalysis PDS Recovery
SW-D9(2.0-2.5)	Hexavalent Chromium	< 85%	< 85%

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample locations SW-D10(4.0-4.5) and SW-D9(2.0-2.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D10(4.0-4.5) / DUP-1(20180619)	Hexavalent Chromium	1.1	0.45 U	AC
SW-D4(0.0-0.5) / DUP-2(20180619)	Hexavalent Chromium	0.56	0.46	AC

Notes:

AC = Acceptable

The differences in the results between the parent sample SW-D10(4.0-4.5) and field duplicate sample DUP-1(20180619) were acceptable.

DATA REVIEW REPORT

The differences in the results between the parent sample SW-D4(0.0-0.5) and field duplicate sample DUP-2(20180619) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

The laboratory duplicate analysis performed on sample locations SW-D10(4.0-4.5) and SW-D9(2.0-2.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D10(4.0-4.5) / DUP-1(20180619)	Redox Potential	340	286	17.3%
	pH	8.05	8.23	2.2%
SW-D4(0.0-0.5) / DUP-2(20180619)	Redox Potential	315	284	10.4%
	pH	8.75	8.22	6.2%

The differences in the results between the parent sample SW-D10(4.0-4.5) and field duplicate sample DUP-1(20180619) were acceptable.

The differences in the results between the parent sample SW-D4(0.0-0.5) and field duplicate sample DUP-2(20180619) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDG #JC68561

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30413R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC68561 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180622)	JC68561-1	Water	6/22/2018		X	X	X
SW-D8(0.0-0.5)	JC68561-2	Soil	6/22/2018		X	X	X
SW-D8(2.0-2.5)	JC68561-3	Soil	6/22/2018		X	X	X
SW-D8(4.0-4.5)	JC68561-4	Soil	6/22/2018		X	X	X
SW-D8(6.0-6.5)	JC68561-5	Soil	6/22/2018		X	X	X
SW-D8(8.0-8.5)	JC68561-6	Soil	6/22/2018		X	X	X
SW-D7(0.0-0.5)	JC68561-7	Soil	6/22/2018		X	X	X
SW-D7(2.0-2.5)	JC68561-8	Soil	6/22/2018		X	X	X
SW-D7(4.0-4.5)	JC68561-9	Soil	6/22/2018		X	X	X
SW-D7(6.0-6.5)	JC68561-10	Soil	6/22/2018		X	X	X
SW-D7(8.0-8.5)	JC68561-11	Soil	6/22/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. The metals analysis for sample SW-D7(8.0-8.5) also included synthetic precipitation leachate procedure (SPLP) nickel.
3. Cr VI is hexavalent chromium.
4. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	SPLP Leachate	180 days from collection to analysis	Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All low-level calibration verification standard recoveries were within control limits of 70% to 130%.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed using a sample from this SDG.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis was not performed using a sample from this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample

DATA REVIEW REPORT

are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed using a sample from this SDG.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample locations SW-D8(2.0-2.5) and SW-D7(8.0-8.5) in association with the insoluble hexavalent chromium analysis exhibited recoveries within the control limits.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-D8(2.0-2.5)	Hexavalent Chromium, Soluble	< 50%	< 50%
SW-D7(8.0-8.5)	Hexavalent Chromium, Soluble	< 50%	Not reanalyzed

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

The PDS analysis performed on sample location SW-D8(2.0-2.5) exhibited a recovery within the control limits.

Spike recoveries were outside of the control limits as presented in the table below.

DATA REVIEW REPORT

Sample Location	Analyte	PDS Recovery
SW-D7(8.0-8.5)	Hexavalent Chromium	< 85%

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample locations SW-D8(2.0-2.5) and SW-D7(8.0-8.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
SW-D8(0.0-0.5) SW-D8(2.0-2.5) SW-D8(4.0-4.5) SW-D8(6.0-6.5) SW-D8(8.0-8.5) SW-D7(0.0-0.5) SW-D7(2.0-2.5) SW-D7(4.0-4.5) SW-D7(6.0-6.5)	SW846 9045D	Analysis: 6 days	< 24 hours of receipt at laboratory

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed greater than two times holding time	J	R

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

DATA REVIEW REPORT

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis performed on sample location FB(20180622) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC68675 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180625)	JC68675-1	Water	6/25/2018		X	X	X
BS-E29	JC68675-2	Soil	6/25/2018		X	X	X
SW-D9(12.0-12.5)	JC68675-3	Soil	6/25/2018		X	X	X
SW-D4(12.0-12.5)	JC68675-4	Soil	6/25/2018		X	X	X
SW-D4(14.0-14.5)	JC68675-5	Soil	6/25/2018		X	X	X
SW-D8(10.0-10.5)	JC68675-6	Soil	6/25/2018		X	X	X
SW-D8(12.0-12.5)	JC68675-7	Soil	6/25/2018		X	X	X
SW-D10(12.0-12.5)	JC68675-8	Soil	6/25/2018		X	X	X
SW-D3(0.0-0.5)	JC68675-9	Soil	6/25/2018		X	X	X
SW-D3(2.0-2.5)	JC68675-10	Soil	6/25/2018		X	X	X
SW-D3(4.0-4.5)	JC68675-11	Soil	6/25/2018		X	X	X
SW-D3(6.0-6.5)	JC68675-12	Soil	6/25/2018		X	X	X
SW-D3(8.0-8.5)	JC68675-13	Soil	6/25/2018		X	X	X
SW-D3(10.0-10.5)	JC68675-14	Soil	6/25/2018		X	X	X
SW-D3(12.0-12.5)	JC68675-15	Soil	6/25/2018		X	X	X
SW-D3(14.0-14.5)	JC68675-16	Soil	6/25/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. The metals analysis for samples SW-D8(10.0-10.5) and SW-D3(6.0-6.5) also included synthetic precipitation leachate procedure (SPLP) nickel.
3. Cr VI is hexavalent chromium.
4. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	SPLP Leachate	180 days from collection to analysis	Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All low-level calibration verification standard recoveries were within control limits of 70% to 130%.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed using a sample from this SDG.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis was not performed using a sample from this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a

DATA REVIEW REPORT

10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed using a sample from this SDG.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
BS-E29	Hexavalent Chromium, Soluble	< 50%	< 50%
	Hexavalent Chromium, Insoluble	69.8%	57.9%

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

Spike recoveries were outside of the control limits as presented in the table below.

Sample Location	Analyte	Initial PDS Recovery	Reanalysis PDS Recovery
BS-E29	Hexavalent Chromium	< 85%	< 85%

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

DATA REVIEW REPORT

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample location BS-E29 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

The laboratory duplicate analysis performed on sample location BS-E29 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Report of Analysis

Client Sample ID: FB(20180625)	Date Sampled: 06/25/18
Lab Sample ID: JC68675-1	Date Received: 06/25/18
Matrix: AQ - Field Blank Soil	Percent Solids: n/a
Project: PPG Site 107, 18 Chapel Avenue, Jersey City, NJ	

General Chemistry

Analyte	Result	RL	Units	DF	Analyzed	By	Method
Chromium, Hexavalent	< 0.010	0.010	mg/l	1	06/25/18 20:50	LS	SW846 7196A
Redox Potential Vs H2	531		mv	1	06/26/18 10:04	RB	ASTM D1498-76
pH ^a	5.61		su	1	06/25/18 17:25	SUB	SM4500H+ B-11

(a) Sample received out of holding time for pH analysis.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDG #JC68783

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30415R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC68783 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180626)	JC68783-1	Water	6/26/2018		X	X	X
SW-D2(0.0-0.5)	JC68783-2	Soil	6/26/2018		X	X	X
SW-D2(2.0-2.5)	JC68783-3	Soil	6/26/2018		X	X	X
SW-D2(4.0-4.5)	JC68783-4	Soil	6/26/2018		X	X	X
SW-D2(6.0-6.5)	JC68783-5	Soil	6/26/2018		X	X	X
SW-D2(8.0-8.5)	JC68783-6	Soil	6/26/2018		X	X	X
SW-D2(10.0-10.5)	JC68783-7	Soil	6/26/2018		X	X	X
SW-D2(12.0-12.5)	JC68783-8	Soil	6/26/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required

9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All analytes associated with low-level calibration verification standard recoveries were within control limits with the exception of the analytes presented in the following table.

DATA REVIEW REPORT

Sample Locations	Analytes	Recovery
SW-D2(0.0-0.5)	Antimony	< 30%
SW-D2(2.0-2.5)		
SW-D2(4.0-4.5)		
SW-D2(6.0-6.5)		
SW-D2(8.0-8.5)	Thallium	> 150%
SW-D2(10.0-10.5)		
SW-D2(12.0-12.5)		

In the case of a deviation, the sample results are qualified.

Low-Level Calibration Standard Recovery Criteria			
Analytes	Control Limit	Sample Result	Qualification
All analytes, with the exception of Al, Ba, Ca, Fe, Mg, Na, and K	%R <50% (<30% for Sb, Pb, Tl)	Sample results \geq MDL but <2x RL	R
		Non-detect sample results	R
		Detected sample results \geq 2x RL	J
	%R 50-69% (30-49% for Sb, Pb, Tl)	Sample results \geq MDL but <2x RL	J
		Non-detect sample results	UJ
		Detected sample results \geq 2x RL	No Action
	%R >130% but <180% (>150% but <200% for Sb, Pb, Tl)	Sample results \geq MDL but <2x RL	J
		Non-detect sample results	No Action
		Detected sample results \geq 2x RL	No Action
	%R >180% (>200% for Sb, Pb, Tl)	Sample results \geq MDL	R

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

DATA REVIEW REPORT

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample location SW-D2(6.0-6.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-D2(6.0-6.5)	Antimony	64.5%	62.9%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using sample SW-D2(6.0-6.5). The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent

DATA REVIEW REPORT

sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample location SW-D2(6.0-6.5) exhibited %D within the control limit.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample location SW-D2(0.0-0.5) in association with the insoluble hexavalent chromium analysis exhibited a recovery within the control limits.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-D2(0.0-0.5)	Hexavalent Chromium, Soluble	< 50%	Not reanalyzed

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analysis of the field samples will be considered usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

The PDS analysis performed on sample location SW-D2(0.0-0.5) exhibited recoveries within the control limits.

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied

DATA REVIEW REPORT

when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample location SW-D2(0.0-0.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

The laboratory duplicate analysis performed on sample location SW-D2(8.0-8.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDG #JC68947

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30416R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC68947 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
DUP-3 (20180628)	JC68947-1	Soil	6/28/2018	SW-D8(14.0-14.5)	X	X	X
SW-D9(14.0-14.5)	JC68947-2	Soil	6/28/2018		X	X	X
SW-D10(14.0-14.5)	JC68947-3	Soil	6/28/2018		X	X	X
SW-D8(14.0-14.5)	JC68947-4	Soil	6/28/2018		X	X	X
FB (20180628)	JC68947-5	Water	6/28/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X ¹	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

¹ The analysis of samples collected from locations SW-D7 and SW-D8 D7 listed on the COC form were cancelled.

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

RA The result was rejected due to deficiencies but is considered usable for decision-making purposes.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All analytes associated with low-level calibration verification standard recoveries were within control limits.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample location SW-D2(6.0-6.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-D9(14.0-14.5)	Nickel	AC (91.6%)	> 125%

Notes:

AC = Acceptable

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. Sample locations associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit are presented in the following table.

Sample Location	Analytes	MS/MSD RPD
SW-D9(14.0-14.5)	Nickel	47.3%

The criteria used to evaluate MS/MSD RPD are presented in the following table. In the case of a MS/MSD RPD deviation, the sample results are qualified. The qualifications are applied to the all sample results associated with this SDG.

Control Limit	Sample Result	Qualification
> 20% (water) or >35% (soil)	Non-detect	UJ
	Detect	J

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D8(14.0-14.5) / DUP-3 (20180628)	Chromium	16.3	21.3	26.6%
	Trivalent Chromium	16.3	21.3	26.6%
	Nickel	93.2	394	124%
	Vanadium	21.4	25.1	AC

Notes:

AC = Acceptable

The nickel results associated with samples locations SW-D8(14.0-14.5) and DUP-3(20180628) were not in agreement. The associated sample results were qualified as estimated.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

DATA REVIEW REPORT

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample location SW-D9(14.0-14.5) exhibited %D within the control limit.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Holding Time	Criteria
FB (20180628)	Analysis: 27 hours	< 24 hours

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

DATA REVIEW REPORT

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-D9(14.0-14.5)	Hexavalent Chromium, Insoluble	< 50%	Not reanalyzed
	Hexavalent Chromium, Soluble	< 50%	Not reanalyzed

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R/RA
	Detect	R/RA
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

Note: Consistent with practices on the PPG remediation program, since the source sample used for MS analysis exhibited a reducing environment, both detected and non-detected hexavalent chromium results were determined to be rejected but acceptable for use ("RA" qualifier).

DATA REVIEW REPORT

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

Spike recoveries were outside of the control limits as presented in the table below.

Sample Location	Analyte	PDS Recovery
SW-D9(14.0-14.5)	Hexavalent Chromium	< 85%

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample location SW-D9(14.0-14.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

DATA REVIEW REPORT

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D8(14.0-14.5) / DUP-3 (20180628)	Hexavalent Chromium	0.59 U	0.55 U	AC

Notes:

AC = Acceptable

The difference in the hexavalent chromium results between the parent sample SW-D8(14.0-14.5) and field duplicate sample DUP-3 (20180628) was acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

The laboratory duplicate analysis performed on sample location SW-D9(14.0-14.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D8(14.0-14.5) / DUP-3 (20180628)	Redox Potential	182	148	20.6%
	pH	6.83	6.65	2.7%

The differences in the results between the parent sample SW-D8(14.0-14.5) and field duplicate sample DUP-3(20180628) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDG #JC69566

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30417R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC69566 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180710)	JC69566-1	Water	7/10/2018		X	X	X
SW-S10(12.0-12.5)A	JC69566-2	Soil	7/10/2018			X	
107-I044	JC69566-3	Soil	7/10/2018		X	X	X
SW-D3(16.0-16.5)	JC69566-4	Soil	7/10/2018		X	X	X
SW-D8(16.0-16.5)	JC69566-5	Soil	7/10/2018		X	X	X
SW-D4(15.5-16.0)	JC69566-6	Soil	7/10/2018		X	X	X
SW-D9(15.5-16.0)	JC69566-7	Soil	7/10/2018		X	X	X
SW-D10(15.5-16.0)	JC69566-8	Soil	7/10/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All analytes associated with low-level calibration verification standard recoveries were within control limits.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

MS/MSD analysis was not performed using a sample from this SDG.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

Laboratory duplicate analysis was not performed using a sample from this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a

DATA REVIEW REPORT

10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

Serial dilution analysis was not performed using a sample from this SDG.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample location 107-I044 in association with the insoluble hexavalent chromium analysis exhibited a recovery within the control limits.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
107-I044	Hexavalent Chromium, Soluble	< 50%	Not reanalyzed

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

Spike recoveries were outside of the control limits as presented in the table below.

Sample Location	Analyte	PDS Recovery
107-I044	Hexavalent Chromium	< 85%

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

DATA REVIEW REPORT

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample location 107-I044 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
107-I044 SW-D3(16.0-16.5) SW-D8(16.0-16.5) SW-D4(15.5-16.0) SW-D9(15.5-16.0) SW-D10(15.5-16.0)	SW846 9045D	Analysis: < 48 hours of receipt at laboratory	< 24 hours of receipt at laboratory

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

DATA REVIEW REPORT

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis performed on sample location 107-I044 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC69982 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180716)	JC69982-1	Water	7/16/2018		X	X	X

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All analytes associated with low-level calibration verification standard recoveries were within control limits.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample location SW-D2(6.0-6.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-D7(10.0-10.5)	Antimony	62.7%	61.9%
SW-D6(0.0-0.5)	Antimony	61.4%	62.0%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using samples SW-D7(10.0-10.5) and SW-D6(0.0-0.5). The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample locations SW-D7(10.0-10.5) and SW-D6(0.0-0.5) exhibited %D within the control limit.

8. System Performance and Overall Assessment

The thallium result in sample SW-D7(14.0-14.5) was reported as non-detected at an elevated reporting limit of 2.8mg/kg. The sample required dilution due to an interfering element.

The antimony result in sample SW-D6(14.0-14.5) was reported as non-detected at an elevated reporting limit of 28mg/kg. The sample required dilution due to an interfering element.

The antimony result in sample SW-D6(10.0-10.5) was reported as non-detected at an elevated reporting limit of 24mg/kg. The sample required dilution due to an interfering element.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample location SW-D1(8.0-8.5) exhibited recoveries within the control limits.

The MS analysis performed on sample location SW-D5(16.0-16.5) in association with the insoluble hexavalent chromium analysis exhibited a recovery within the control limits.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-D5(16.0-16.5)	Hexavalent Chromium, Soluble	< 50%	< 50%

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

Spike recoveries were outside of the control limits as presented in the table below.

DATA REVIEW REPORT

Sample Location	Analyte	Initial PDS Recovery	Reanalysis PDS Recovery
SW-D5(16.0-16.5)	Hexavalent Chromium	< 85%	AC

Notes:

AC = Acceptable

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample locations SW-D1(8.0-8.5) and SW-D5(16.0-16.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
SW-D1(20.0-20.5) SW-D6(0.0-0.5) SW-D11(20.0-20.5) SW-D11(18.0-18.5) SW-D11(16.0-16.5) SW-D11(14.0-14.5) SW-D11(12.0-12.5) SW-D6(20.0-2.5) SW-D6(18.0-18.5) SW-D6(16.0-16.5) SW-D6(14.0-14.5) SW-D6(10.0-10.5) SW-D5(20.0-20.5) SW-D5(18.0-18.5) SW-D5(16.0-16.5) SW-D5(14.0-14.5) SW-D6(12.0-12.5)	SW846 9045D	Analysis: < 48 hours of receipt at laboratory	< 24 hours of receipt at laboratory

Sample results were qualified as specified in the table below. All other holding times were met.

DATA REVIEW REPORT

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis performed on sample locations FB(20180716), SW-D7(10.0-10.5), and SW-D1(20.0-20.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

DATA REVIEW REPORT

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDG #JC70061

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30419R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC70061 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB(20180717)	JC70061-1	Water	7/17/2018		X	X	X
SW-D11(0.0-0.5)	JC70061-2	Soil	7/17/2018		X	X	X

SW-D5(6.0-6.5)	JC70061-11	Soil	7/17/2018		X	X	X
SW-D5(8.0-8.5)	JC70061-12	Soil	7/17/2018		X	X	X
SW-D5(10.0-10.5)	JC70061-13	Soil	7/17/2018		X	X	X
SW-D5(12.0-12.5)	JC70061-14	Soil	7/17/2018		X	X	X
SW-D6(2.0-2.5)	JC70061-15	Soil	7/17/2018		X	X	X
SW-D6(4.0-4.5)	JC70061-16	Soil	7/17/2018		X	X	X
SW-D6(6.0-6.5)	JC70061-17	Soil	7/17/2018		X	X	X
SW-D6(8.0-8.5)	JC70061-18	Soil	7/17/2018		X	X	X
DUP-5(20180717)	JC70061-19	Soil	7/17/2018	SW-D6(4.0-4.5)	X	X	X
DUP-6(20180717)	JC70061-20	Soil	7/17/2018	SW-D6(6.0-6.5)	X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required

1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All analytes associated with low-level calibration verification standard recoveries were within control limits.

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample location SW-D2(6.0-6.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-D6(4.0-4.5)	Antimony	59.4%	56.7%
SW-D6(6.0-6.5)	Antimony	64.8%	63.4%
	Nickel	44.5%	< 30%

Notes:

AC = Acceptable

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water

DATA REVIEW REPORT

matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using samples SW-D6(4.0-4.5) and SW-D6(6.0-6.5). The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D6(4.0-4.5) / DUP-5(20180717)	Chromium	19.3	20.7	7.0%
	Trivalent Chromium	16.9	19.9	16.3%
	Nickel	276	521	61.5%
	Vanadium	25.2	26.5	AC
SW-D6(6.0-6.5) / DUP-6(20180717)	Chromium	19.9	19.5	2.0%
	Trivalent Chromium	18.2	18.2	0.0%
	Nickel	676	855	23.4%
	Vanadium	27.7	28.4	AC

Notes:

AC = Acceptable

The nickel results associated with samples locations SW-D6(4.0-4.5) and DUP-5(20180717) were not in agreement. The associated sample results were qualified as estimated.

The differences in the metals results between the parent sample SW-D6(6.0-6.5) and field duplicate sample DUP-6 (20180717) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample

DATA REVIEW REPORT

are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample locations SW-D6(4.0-4.5) and SW-D6(6.0-6.5) exhibited %D within the control limit.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample locations SW-D6(4.0-4.5) and SW-D6(6.0-6.5) in association with the insoluble hexavalent chromium analysis exhibited a recovery within the control limits.

Spike recoveries were less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-D6(4.0-4.5)	Hexavalent Chromium, Soluble	< 50%	< 50%
SW-D6(6.0-6.5)	Hexavalent Chromium, Soluble	< 50%	< 50%

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS/MSD must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

Spike recoveries were outside of the control limits as presented in the table below.

Sample Location	Analyte	Initial PDS Recovery	Reanalysis PDS Recovery
SW-D6(4.0-4.5)	Hexavalent Chromium	< 85%	< 85%
SW-D6(6.0-6.5)	Hexavalent Chromium	< 85%	< 85%

DATA REVIEW REPORT

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample location SW-D6(6.0-6.5) exhibited results within the control limit.

All analytes associated with laboratory duplicate RPD were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes
SW-D6(4.0-4.5)	Hexavalent Chromium

The criteria used to evaluate laboratory duplicate RPD are presented in the following table. In the case of a laboratory duplicate RPD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Sample Concentration	Control Limit	Sample Result	Qualification
Parent sample and/or laboratory duplicate sample result \leq five times the RL	\pm RL	Non-detect	UJ
		Detect	J

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

DATA REVIEW REPORT

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D6(4.0-4.5) / DUP-5(20180717)	Hexavalent Chromium	2.4	0.82	NC
SW-D6(6.0-6.5) / DUP-6(20180717)	Hexavalent Chromium	1.7	1.3	AC

Notes:

AC = Acceptable

NC = Not compliant

The hexavalent chromium results associated with samples locations SW-D6(4.0-4.5) and DUP-5(20180717) were not in agreement. The associated sample results were qualified as estimated.

The difference in the hexavalent chromium results between the parent sample SW-D6(6.0-6.5) and field duplicate sample DUP-6 (20180717) was acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for redox potential and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

The laboratory duplicate analysis performed on sample locations SW-D6(4.0-4.5) and SW-D6(6.0-6.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-D6(4.0-4.5) / DUP-5(20180717)	Redox Potential	142	191	29.4%
	pH	10.62	10.29	3.2%
SW-D6(6.0-6.5) / DUP-6(20180717)	Redox Potential	54.3	95.6	55.1%
	pH	10.48	11.06	5.4%

The differences in the results between the parent sample SW-D6(4.0-4.5) and field duplicate sample DUP-5(20180717) were acceptable.

The redox potential results associated with samples locations SW-D6(6.0-6.5) and DUP-6(20180717) were not in agreement. The associated sample results were qualified as estimated.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SDGs #JC69017, JC69227, and JC69374

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30550R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # JC69017, JC69227, and JC69374 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						Cr VI	MET	MISC
JC69017	FB (20180629)	JC69017-1	Water	6/29/2018		X	X	X
	SW-A1 (0.0-0.5)	JC69017-2	Soil	6/29/2018		X	X	X
	SW-A1- (2.0-2.5)	JC69017-3	Soil	6/29/2018		X	X	X
	SW-A1 (4.0-4.5)	JC69017-4	Soil	6/29/2018		X	X	X
JC69227	FB (20180703)	JC69227-1	Water	7/3/2018		X	X	X
	SW-A2 (4.0-4.5)	JC69227-2	Soil	7/3/2018		X	X	X
	SW-A2 (2.0-2.5)	JC69227-3	Soil	7/3/2018		X	X	X
	SW-A2 (0.0-0.5)	JC69227-4	Soil	7/3/2018		X	X	X
JC69374	FB (20180706)	JC69374-1	Water	7/6/2018		X	X	X
	SW-A3 (0.0-0.5)	JC69374-2	Soil	7/6/2018		X	X	X
	SW-A3 (2.0-2.5)	JC69374-3	Soil	7/6/2018		X	X	X
	SW-A3 (4.0-4.5)	JC69374-4	Soil	7/6/2018		X	X	X
	SW-A4 (0.0-0.5)	JC69374-5	Soil	7/6/2018		X	X	X
	SW-A4 (2.0-2.5)	JC69374-6	Soil	7/6/2018		X	X	X
	SW-A4 (4.0-4.5)	JC69374-7	Soil	7/6/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

SDGs #JC69017 and JC69374: The MS/MSD analysis was not performed using a sample from these SDGs.

SDG #JC69227: The MS/MSD analysis performed on sample location SW-A2 (4.0-4.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-A2 (4.0-4.5)	Antimony	65.7%	67.1%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

DATA REVIEW REPORT

parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDGs #JC69017 and JC69374: The laboratory duplicate analysis was not performed using a sample from these SDGs.

SDG #JC69227: MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using sample SW-A2 (4.0-4.5). The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with these SDGs.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

SDGs #JC69017 and JC69374: The serial dilution analysis was not performed using a sample from these SDGs.

SDG #JC69227: The serial dilution performed on sample location SW-A2 (4.0-4.5) exhibited %D within control limits.

8. System Performance and Overall Assessment

SDG #JC69017: The thallium result in sample SW-A1 (2.0-2.5) was reported as non-detected at an elevated reporting limit of 2.3mg/kg. The sample required dilution due to an interfering element.

SDG #JC69374: The thallium result in sample SW-A3 (0.0-0.5) was reported as non-detected at an elevated reporting limit of 2.1mg/kg. The sample required dilution due to an interfering element.

SDG #JC69374: The thallium result in sample SW-A4 (0.0-0.5) was reported as non-detected at an elevated reporting limit of 2.5mg/kg. The sample required dilution due to an interfering element.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

SDGs #JC69017 and JC69227: The MS analysis performed on sample locations SW-A1 (0.0-0.5) and SW-A2 (4.0-4.5) in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

SDG #JC69374: The MS analysis performed on sample location SW-A3 (0.0-0.5) exhibited an acceptable insoluble hexavalent chromium recovery. The soluble hexavalent chromium spike recovery was less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
SW-A3 (0.0-0.5)	Hexavalent Chromium, Soluble	55.5%	--
SW-A3 (2.0-2.5)	Hexavalent Chromium, Soluble	--	AC (95%)

Notes:

AC Acceptable

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

Since the MS analysis associated with the reanalysis of the samples was performed using a different sample than the original analysis, the results from the original analysis of the samples are usable with appropriate qualification. No sample results were rejected. In addition, the trivalent chromium results in samples SW-A3 (4.0-4.5) and SW-A4 (0.0-0.5) were also qualified since the hexavalent chromium result was greater than 10% of the total chromium concentration.

DATA REVIEW REPORT

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

SDGs #JC69017, JC69227, and JC69374: The PDS analysis performed on sample locations SW-A1 (0.0-0.5), SW-A2 (4.0-4.5), and SW-A3 (0.0-0.5) exhibited recoveries within the control limits.

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

SDG #JC69017, JC69227, and JC69374: The laboratory duplicate analysis performed on sample locations SW-A1 (0.0-0.5), SW-A2 (4.0-4.5), and SW-A3 (0.0-0.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with these SDGs.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

SDG #JC69374: All samples were analyzed within the specified holding times.

SDGs #JC69017 and JC69227: The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
SW-A1 (0.0-0.5) SW-A1- (2.0-2.5) SW-A1 (4.0-4.5) SW-A2 (4.0-4.5) SW-A2 (2.0-2.5) SW-A2 (0.0-0.5)	SW846 9045D	Analysis: 3 days	< 24 hours of receipt at laboratory

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification
	Detected Analytes
Analysis completed greater than two times holding time	J

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The

DATA REVIEW REPORT

BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDG #JC69017 and JC69227: The laboratory duplicate analysis performed on sample location FB (20180629), FB (20180703), and SW-A2 (2.0-2.5) exhibited results within the control limit.

SDG #JC69374: The laboratory duplicate analysis was not performed using a sample from this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with these SDGs.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Report #30551R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # JC69771, JC69872, JC70231, and JC70487 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						Cr VI	MET	MISC
JC69771	FB (20180712)	JC69771-1	Water	7/12/2018		X	X	X

	BS-D6A	JC70487-2	Soil	7/24/2018		X		
	BS-F6	JC70487-3	Soil	7/24/2018		X	X	X
	BS-D7	JC70487-4	Soil	7/24/2018		X	X	X
	BS-E7	JC70487-5	Soil	7/24/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

SDGs #JC69771, JC70231, and JC70487: The MS/MSD analysis was not performed using a sample from these SDGs.

SDG #JC69872: The MS/MSD analysis performed on sample location SW-A4 (6.0-6.5) exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-A4 (6.0-6.5)	Antimony	57.9%	69.2%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

DATA REVIEW REPORT

parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDGs #JC69771, JC70231, and JC70487: The laboratory duplicate analysis was not performed using a sample from these SDGs.

SDG #JC69872: MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using sample SW-A4 (6.0-6.5). The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-A3 (5.5-6.0) DUP-4 (20180713)	Chromium	62.7	82.3	27.0%
	Trivalent Chromium	54.7	72.5	28.0%
	Nickel	14.6	13.2	AC
	Vanadium	26.8	25.1	

Notes:

AC = Acceptable

The differences in the results between the parent sample SW-A3 (5.5-6.0) and field duplicate sample DUP-4 (20180713) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

SDGs #JC69771, JC70231, and JC70487: The serial dilution analysis was not performed using a sample from these SDGs.

DATA REVIEW REPORT

SDG #JC69872: The serial dilution performed on sample location SW-A4 (6.0-6.5) exhibited %D within control limits, with the exception of the analytes presented in the following table.

Sample Locations	Analytes	Serial Dilution (%D)
SW-A4 (6.0-6.5)	Chromium	10.4%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below. The qualifications are applied to all sample results associated with the sample preparation batch.

Control Limit	Sample Result	Qualification
> 10%	Non-detect	UJ
	Detect	J

8. System Performance and Overall Assessment

SDG #JC69872: The thallium result in sample SW-A1 (6.0-6.5) was reported as non-detected at an elevated reporting limit of 2.2mg/kg. The sample required dilution due to an interfering element.

SDG #JC70487: The thallium result in sample BS-E7 was reported as non-detected at an elevated reporting limit of 2.5mg/kg. The sample required dilution due to an interfering element.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample locations BS-D5, SW-A4 (6.0-6.5), BS-E6, and BS-D6A in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

The PDS analysis performed on sample locations BS-D5, SW-A4 (6.0-6.5), BS-E6, and BS-D6A exhibited recoveries within the control limits.

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample locations BS-D5, SW-A4 (6.0-6.5), BS-E6, and BS-D6A exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-A3 (5.5-6.0) / DUP-4 (20180713)	Hexavalent Chromium	8.0	9.8	20.2%

The difference in the hexavalent chromium results between the parent sample SW-A3 (5.5-6.0) and field duplicate sample DUP-4 (20180713) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

SDGs #JC69771 and JC70231: The laboratory duplicate analysis was not performed using a sample from these SDGs.

SDGs #JC69872 and JC70487: The laboratory duplicate analysis performed on sample locations SW-A4 (6.0-6.5) and BS-D6A exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-A3 (5.5-6.0) / DUP-4 (20180713)	Redox Potential	359	354	1.4%
	pH	7.46	7.42	0.5%

The differences in the results between the parent sample SW-A3 (5.5-6.0) and field duplicate sample DUP-4 (20180713) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDGs #JC70911 and JC70989

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30552R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # JC70911 and JC70989 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						Cr VI	MET	MISC
JC70911	FB (20180730)	JC70911-1	Water	7/30/2018		X	X	X
	BS-E7A	JC70911-2	Soil	7/30/2018		X	X	X
	BS-F7	JC70911-3	Soil	7/30/2018		X	X	X
	BS-C7	JC70911-4	Soil	7/30/2018		X	X	X
	BS-F8	JC70911-5	Soil	7/30/2018		X	X	X
JC70989	FB (20180731)	JC70989-1	Water	7/31/2018		X	X	X
	BS-E8	JC70989-2	Soil	7/31/2018		X	X	X
	DUP-7 (20180731)	JC70989-3	Soil	7/31/2018	BS-E8	X	X	X
	BS-D8	JC70989-4	Soil	7/31/2018		X	X	X
	DUP-8 (20180731)	JC70989-5	Soil	7/31/2018	BS-D8	X	X	X
	BS-C8	JC70989-6	Soil	7/31/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

SDGs # JC70911: The MS/MSD analysis was not performed using a sample from this SDG.

SDG #JC70989: The MS/MSD analysis performed on sample location BS-D8 and BS-C8 exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
BS-D8	Antimony	54.2%	54.9%
BS-C8	Antimony	66.6%	64.3%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

DATA REVIEW REPORT

parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDG #JC70911: The laboratory duplicate analysis was not performed using a sample from this SDG.

SDG #JC70989: MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using sample BS-C8. The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-E8 / DUP-7 (20180731)	Chromium	15.1	15.5	2.6%
	Trivalent Chromium	15.1	15.5	2.6%
	Nickel	12.3	12.8	AC
	Vanadium	22.7	22.9	
BS-D8 / DUP-8 (20180731)	Chromium	18.0	16.1	11.1%
	Trivalent Chromium	18.0	15.6	14.3%
	Nickel	13.5	12.1	AC
	Vanadium	23.8	23.1	

Notes:

AC = Acceptable

The differences in the results between the parent sample BS-E8 and field duplicate sample DUP-7 (20180731) were acceptable.

The differences in the results between the parent sample BS-D8 and field duplicate sample DUP-8 (20180731) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample

DATA REVIEW REPORT

are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

SDGs #JC70911: The serial dilution analysis was not performed using a sample from this SDG.

SDG #JC70989: The serial dilution performed on sample location BS-C8 exhibited %D within control limits.

SDG #JC70989: The serial dilution performed on sample location BS-D8 exhibited %D within control limits with the exception of the analytes presented in the following table.

Sample Locations	Analytes	Serial Dilution (%D)
BS-D8	Chromium	12.5%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below. The qualifications are applied to all sample results associated with the sample preparation batch.

Control Limit	Sample Result	Qualification
> 10%	Non-detect	UJ
	Detect	J

8. System Performance and Overall Assessment

SDG #JC70989: The thallium result in sample BS-C8 was reported as non-detected at an elevated reporting limit of 2.4mg/kg. The sample required dilution due to an interfering element.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

SDGs #JC70911 and JC70989: The MS analysis performed on sample locations BS-E7A and BS-C8 in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

SDG #JC70989: The MS analysis performed on sample location BS-D8 exhibited insoluble and soluble hexavalent chromium spike recoveries less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
BS-D8	Hexavalent Chromium, Soluble	< 50%	52.1%
	Hexavalent Chromium, Insoluble	70.2%	AC (85.3%)

Notes:

AC Acceptable

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

The PDS analysis performed on sample locations BS-E7A, BS-D8, and BS-C8 exhibited recoveries within the control limits.

DATA REVIEW REPORT

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample locations BS-E7A, BS-D8, and BS-C8 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-E8 / DUP-7 (20180731)	Hexavalent Chromium	0.47 U	0.48 U	AC
BS-D8 / DUP-8 (20180731)	Hexavalent Chromium	0.50 U	0.50 U	AC

Notes:

AC = Acceptable

Hexavalent chromium was not detected in the parent sample BS-E8 and field duplicate sample DUP-7 (20180731).

Hexavalent chromium was not detected in the parent sample BS-D8 and field duplicate sample DUP-8 (20180731).

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

DATA REVIEW REPORT

SDGs #JC70911: The laboratory duplicate analysis was not performed using a sample from this SDG.

SDGs #JC70989: The laboratory duplicate analysis performed on sample locations BS-D8 and BS-C8 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-E8 / DUP-7 (20180731)	Redox Potential	214	194	9.8%
	pH	6.98	7.04	0.9%
BS-D8 / DUP-8 (20180731)	Redox Potential	227	205	10.2%
	pH	6.85	6.85	0.0%

The differences in the results between the parent sample BS-E8 and field duplicate sample DUP-7 (20180731) were acceptable.

The differences in the results between the parent sample BS-D8 and field duplicate sample DUP-8 (20180731) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # JC71067 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					Cr VI	MET	MISC
FB (20180801)	JC71067-1	Water	8/1/2018		X	X	X
SW-A61 (0.0-0.5)	JC71067-2	Soil	8/1/2018		X	X	X
SW-A61 (2.0-2.5)	JC71067-3	Soil	8/1/2018		X	X	X
SW-A61 (4.0-4.5)	JC71067-4	Soil	8/1/2018		X	X	X
SW-A61 (6.0-6.5)	JC71067-5	Soil	8/1/2018		X	X	X
BS-G5T	JC71067-6	Soil	8/1/2018		X	X	X
SW-A60 (0.0-0.5)	JC71067-7	Soil	8/1/2018		X	X	X
SW-A60 (2.0-2.5)	JC71067-8	Soil	8/1/2018		X	X	X
SW-A60 (4.0-4.5)	JC71067-9	Soil	8/1/2018		X	X	X

BS-H5T	JC71067-11	Soil	8/1/2018		X	X	X
SW-A59 (0.0-0.5)	JC71067-12	Soil	8/1/2018		X	X	X
SW-A59 (2.0-2.5)	JC71067-13	Soil	8/1/2018		X	X	X
SW-A59 (4.0-4.5)	JC71067-14	Soil	8/1/2018		X	X	X
SW-A59 (6.0-6.5)	JC71067-15	Soil	8/1/2018		X	X	X
BS-I5T	JC71067-16	Soil	8/1/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed using a sample from this SDG.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis was not performed using a sample from this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a

DATA REVIEW REPORT

10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed using a sample from this SDG.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

The MS analysis performed on sample location SW-A61 (0.0-0.5) in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

The PDS analysis performed on sample location SW-A61 (0.0-0.5) exhibited recoveries within the control limits.

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

All analytes associated with laboratory duplicate RPD were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes
SW-A61 (0.0-0.5)	Hexavalent Chromium

The criteria used to evaluate laboratory duplicate RPD are presented in the following table. In the case of a laboratory duplicate RPD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Sample Concentration	Control Limit	Sample Result	Qualification
Parent sample and/or laboratory duplicate sample result > four times the RL	RPD <20%	Non-detect	UJ
		Detect	J

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

DATA REVIEW REPORT

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
SW-A61 (0.0-0.5)	SW846 9045D	Analysis: 7 days	< 24 hours of receipt at laboratory
SW-A61 (2.0-2.5)			
SW-A61 (4.0-4.5)			
SW-A61 (6.0-6.5)			
BS-G5T			
SW-A60 (0.0-0.5)			
SW-A60 (2.0-2.5)			
SW-A60 (4.0-4.5)			
SW-A60 (6.0-6.5)			
BS-H5T			
SW-A59 (0.0-0.5)			
SW-A59 (2.0-2.5)			
SW-A59 (4.0-4.5)			
SW-A59 (6.0-6.5)			
BS-I5T			

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed greater than two times holding time	J	R

DATA REVIEW REPORT

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis performed on sample location SW-A61 (0.0-0.5) exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # JC71184, JC71368, JC71451, JC71526, and JC71706 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						Cr VI	MET	MISC
JC71184	FB (20180802)	JC71184-1	Water	8/2/2018		X	X	X

	FB (081018)	JC71706-4	Water	8/10/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Method (SM) 4500H+B; and ASTM D1498-76. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

SDGs #JC71368, JC71451, JC71526, and JC71706: The MS/MSD analysis was not performed using a sample from these SDGs.

SDG #JC71184: The MS/MSD analysis performed on sample location BS-H5 exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
BS-H5	Antimony	53.0%	55.3%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

DATA REVIEW REPORT

parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDG #JC71184: MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using sample BS-H5. The MS/MSD recoveries exhibited acceptable RPDs.

SDGs #JC71368, JC71451, JC71526, and JC71706: The laboratory duplicate analysis was not performed using a sample from these SDGs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-I5 / DUP-9 (20180802)	Chromium	17.8	19.6	9.6%
	Vanadium	29.4	29.5	0.3%
	Trivalent Chromium	16.4	18.0	9.3%
	Nickel	14.0	13.6	AC

Notes:

AC = Acceptable

The differences in the results between the parent sample BS-I5 and field duplicate sample DUP-9 (20180802) were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

SDG #JC71184: The serial dilution performed on sample location BS-H5 exhibited %D within control limits.

DATA REVIEW REPORT

SDGs #JC71368, JC71451, JC71526, and JC71706: The serial dilution analysis was not performed using a sample from these SDGs.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

SDGs #JC71184, JC71368, JC71451, and JC71706: The MS analysis performed on sample locations BS-H5, BS-G5, BS-H7, and BS-G6A in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

SDG #JC71526: The MS analysis was not performed using a sample from this SDG.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

SDGs #JC71184, JC71368, JC71451, and JC71706: The PDS analysis performed on sample locations BS-H5, BS-G5, BS-H7, and BS-G6A exhibited recoveries within the control limits.

SDG #JC71526: The PDS analysis was not performed using a sample from this SDG.

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

SDGs #JC71184, JC71368, JC71451, and JC71706: The laboratory duplicate analysis performed on sample locations BS-H5, BS-G5, BS-H7, and BS-G6A exhibited results within the control limit.

SDG #JC71526: The laboratory duplicate analysis was not performed using a sample from this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-I5 / DUP-9 (20180802)	Hexavalent Chromium	1.4	1.6	AC

Notes:

AC = Acceptable

The differences in the hexavalent chromium results between the parent sample BS-I5 and field duplicate sample DUP-9 (20180802) were acceptable.

DATA REVIEW REPORT

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C

SDGs #JC71184 and JC71451: All samples were analyzed within the specified holding times.

SDGs #JC71368, JC71526, and JC71706: The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
BS-G5	SW846 9045D	Analysis: 3 days	< 24 hours of receipt at laboratory
BS-H6T BS-I6T BS-G6A BS-G7A BS-H7A	SW846 9045D	Analysis: 2 days	< 24 hours of receipt at laboratory

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

DATA REVIEW REPORT

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDGs #JC71184, JC71526, and JC71706: The laboratory duplicate analysis performed on sample locations BS-H5, BS-H6T, and FB (081018) exhibited results within the control limit.

SDGs #JC71368 and JC71541: The laboratory duplicate analysis was not performed using a sample from these SDGs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-I5 / DUP-9 (20180802)	Redox Potential	222	306	31.8%
	pH	9.27	8.81	5.1%

The differences in the results between the parent sample BS-I5 and field duplicate sample DUP-9 (20180802) were acceptable.

DATA REVIEW REPORT

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential and pH were not reported in the analytical report.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # JC71945, JC72118, JC72252, and JC72335 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						Cr VI	MET	MISC
JC71945	BS-F9	JC71945-1	Soil	8/15/2018		X	X	X
	BS-E9	JC71945-2	Soil	8/15/2018		X	X	X
	BS-H7B	JC71945-3	Soil	8/15/2018		X	X	X
	BS-G8	JC71945-4	Soil	8/15/2018		X	X	X
	BS-H8	JC71945-5	Soil	8/15/2018		X	X	X
	FB (20180815)	JC71945-6	Water	8/15/2018		X	X	X
JC72118	BS-G9	JC72118-1	Soil	8/17/2018		X	X	X
	DUP-1 (20180817)	JC72118-2	Soil	8/17/2018	BS-G9	X	X	X
	BS-H9	JC72118-3	Soil	8/17/2018		X	X	X
	FB (20180817)	JC72118-5	Water	8/17/2018		X	X	X
JC72252	BS-H7C	JC72252-1	Soil	8/21/2018		X	X	X
	FB (20180821)	JC72252-2	Water	8/21/2018		X	X	X
JC72335	BS-C10	JC72335-1	Soil	8/22/2018		X	X	X
	BS-D10	JC72335-2	Soil	8/22/2018		X	X	X
	FB (20180822)	JC72335-3	Water	8/22/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.
4. SDGs #JC71945 and JC72335: Miscellaneous parameters for samples BS-F9 and BS-C10 also include ferrous iron, sulfide screen, and total organic carbon (TOC).

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Methods (SM) 4500H+B and SM4500S2-A; Lloyd Kahn; and ASTM D1498-76 and D3872-86. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed using a sample from these SDGs.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis was not performed using a sample from these SDGs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-G9 / DUP-1 (20180817)	Chromium	19.4	18.3	5.8%
	Nickel	44.4	43.4	2.3%
	Trivalent Chromium	19.4	18.3	5.8%
	Vanadium	24.2	21.9	AC

Notes:

AC = Acceptable

DATA REVIEW REPORT

The differences in the results between the parent sample BS-G9 and field duplicate sample DUP-1 (20180817) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed using a sample from these SDGs.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

SDGs #JC72118 and JC72252: The MS analysis performed on sample locations BS-H9 and BS-H7C in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

SDGs #JC71945 and JC72335: The MS analysis performed on sample locations BS-F9 and BS-C10 exhibited insoluble and soluble hexavalent chromium spike recoveries less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
BS-F9	Hexavalent Chromium, Soluble	< 50%	< 50%
	Hexavalent Chromium, Insoluble	55.1%	AC (86.4%)
BS-C10	Hexavalent Chromium, Soluble	< 50%	< 50%
	Hexavalent Chromium, Insoluble	69.4%	74.0%

Notes:

AC Acceptable

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that

DATA REVIEW REPORT

has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

SDG #JC71945, JC72118, and JC72252: The PDS analysis performed on sample locations BS-F9, BS-H9, and BS-H7C exhibited recoveries within the control limits.

SDG #JC72335: The PDS recoveries were outside of the control limits as presented in the table below.

Sample Location	Analyte	Initial PDS Recovery	Reanalysis PDS Recovery
BS-C10	Hexavalent Chromium	< 85%	< 85%

Since all the samples are from the same site, it is assumed the matrix interference exists for all samples in a reducing environment. It was noted from the Eh pH results that soil samples are in a reducing environment and don't support the presence of hexavalent chromium.

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
PDS recovery < 85%	Non-detect	UJ-
	Detect	J-
PDS recovery > 115%	Non-detect	No Action
PDS recovery > 115%	Detect	J+

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

SDGs #JC71945, JC72252, and JC72335: The laboratory duplicate analysis performed on sample locations BS-F9, BS-H7C, and BS-C10 exhibited results within the control limit.

SDG #JC72118: All analytes associated with laboratory duplicate were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes
BS-H9	Hexavalent Chromium

The criteria used to evaluate laboratory duplicate RPD are presented in the following table. In the case of a laboratory duplicate RPD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

DATA REVIEW REPORT

Sample Concentration	Control Limit	Sample Result	Qualification
Parent sample and/or laboratory duplicate sample result < four times the RL	± RL	Non-detect	UJ
		Detect	J

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-G9 / DUP-1 (20180817)	Hexavalent Chromium	0.53 U	0.50 U	AC

Notes:

AC = Acceptable

Hexavalent chromium was not detected in the parent sample BS-G9 and field duplicate sample DUP-1 (20180817).

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C
Ferrous Iron by ASTM D3872-86	Soil	24 hours from collection to analysis	Cool to <6°C
Sulfide Screen by SM4500S2-A	Soil	7 days from collection to analysis	Cool to <6°C
Total Organic Carbon (TOC) by Lloyd Kahn	Soil	14 days from collection to analysis	Cool to <6°C

SDG #JC72252: All samples were analyzed within the specified holding times.

SDGs #JC71945, JC72118, and JC72335: The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
BS-F9	ASTM D3872-86	Analysis: 5 days	< 24 hours from collection
BS-C10		Analysis: 6 days	
BS-G9 DUP-1 (20180817) BS-H9	SW846 9045D	Analysis: 3 days	< 24 hours of receipt at laboratory

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed greater than two times holding time	J	R

DATA REVIEW REPORT

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

Ferrous iron, sulfide, and TOC were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDG #JC71945: The laboratory duplicate analysis was not performed using a sample from this SDG.

SDGs #JC72118, JC72252, and JC72335: The laboratory duplicate analysis performed on sample locations DUP-1 (20180817), FB (20180817), BS-H7C, and BS-C10 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

DATA REVIEW REPORT

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
BS-G9 / DUP-1 (20180817)	Redox Potential	297	326	9.3%
	pH	7.05	7.00	0.7%

The differences in the results between the parent sample BS-G9 and field duplicate sample DUP-1 (20180817) were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential, pH, and sulfide screen were not reported in the analytical report.

The LCS analysis performed in association with ferrous iron and TOC exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA QUALITY ASSESSMENT

Site 107 Fashionland

Jersey City, New Jersey

Metals, Hexavalent Chromium, and Miscellaneous Analyses

SDGs #JC72443, JC72521, and JC72616

Analyses Performed By:

SGS Accutest

Dayton, New Jersey

Report #30556R

Review Level: Tier III

Project: NP000770.0001.00008

DATA REVIEW REPORT

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # JC72443, JC72521, and JC72616 for samples collected in association with the PPG Industries Site 107 Fashionland, Jersey City, New Jersey Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						Cr VI	MET	MISC
JC72443	FB (20180823)	JC72443-1	Water	8/23/2018		X	X	X
	BS-D9	JC72443-2	Soil	8/23/2018		X	X	X
	BS-E10	JC72443-3	Soil	8/23/2018		X	X	X
	BS-F10	JC72443-4	Soil	8/23/2018		X	X	X
	BS-G10	JC72443-5	Soil	8/23/2018		X	X	X
JC72521	FB (20180824)	JC72521-1	Water	8/24/2018		X		X
	BS-H7D	JC72521-2	Soil	8/24/2018		X		X
JC72616	FB (20180827)	JC72616-1	Water	8/27/2018		X	X	X
	BS-C9	JC72616-2	Soil	8/27/2018		X	X	X
	BS-H10	JC72616-3	Soil	8/27/2018		X	X	X
	BS-I10	JC72616-4	Soil	8/27/2018		X	X	X
	BS-C11	JC72616-5	Soil	8/27/2018		X	X	X
	BS-D11	JC72616-6	Soil	8/27/2018		X	X	X
	BS-E11	JC72616-7	Soil	8/27/2018		X	X	X
	BS-F11	JC72616-8	Soil	8/27/2018		X	X	X

Notes:

1. Metals include antimony, chromium, nickel, thallium, and vanadium. Trivalent chromium is reported by calculation (Chromium) – (Hexavalent Chromium).
2. Cr VI is hexavalent chromium.
3. Miscellaneous parameters include pH and redox potential.
4. SDGs #JC72334 and JC72616: Miscellaneous parameters for samples BS-D9 and BS-C9 also include ferrous iron, sulfide screen, and total organic carbon (TOC).

QA - Quality Assurance

DATA REVIEW REPORT

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C, 7196A, and 9045D; Standard Methods (SM) 4500H+B and SM4500S2-A; Lloyd Kahn; and ASTM D1498-76 and D3872-86. Data were reviewed in accordance with USEPA Region 2 SOP HW-2b, Revision 15 (December 2012); New Jersey Division of Remediation Management and Response Standard Operating Procedure for Analytical Data Validation of Hexavalent Chromium (September 2009); New Jersey Department of Environmental Protection Data Quality Assessment and Data Usability Evaluation Technical Guidance (April 2014); Field Sampling Plan/Quality Assurance Project Plan, PPG Non-Residential and Residential Chromium Sites, Hudson County, New Jersey (AECOM, June 2010); and Arcadis Quality Assurance Project Plan – Addendum, Site 107 Fashionland, Jersey City, New Jersey (Arcadis, June 2018).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - J+ The result is an estimated quantity, but the result may be biased high.
 - J- The result is an estimated quantity, but the result may be biased low.
 - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

DATA REVIEW REPORT

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

DATA REVIEW REPORT

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2; Cool to <6°C
	Soil	180 days from collection to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.998 and all initial calibration verification standard and continuing calibration verification standard recoveries were within control limits of 90% to 110%.

All continuing calibration verification standard recoveries were within the control limit.

3.2 Low-Level Calibration Verification

The low-level initial and continuing calibration check standard serves to verify the linearity of calibration of the analysis at the reporting limit.

All RL standard recoveries were within control limits of 70% to 130% (50% to 150% for antimony and thallium).

DATA REVIEW REPORT

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits of 80% to 120%.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

SDG #JC72443: The MS/MSD analysis was not performed using a sample from this SDG.

SDG #JC72616: The MS/MSD analysis performed on sample location BS-H10 exhibited recoveries within the control limits with the exception of the analytes presented in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
BS-H10	Antimony	72.8%	AC (75.6%)

Notes:

AC Acceptable

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the sample preparation batch.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ-
	Detect	J-
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J-
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J+

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

DATA REVIEW REPORT

parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

SDG #JC72443: The laboratory duplicate analysis was not performed using a sample from this SDG.

SDG #JC72616: MS/MSD analysis was performed in replacement of the laboratory duplicate analysis using sample BS-H10. The MS/MSD recoveries exhibited acceptable RPDs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with these SDGs.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 10 times the RL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

SDG #JC72443: The serial dilution analysis was not performed using a sample from this SDG.

SDG #JC72616: The serial dilution performed on sample location BS-H10 exhibited %D within control limits.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

HEXAVALENT CHROMIUM ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 7196A	Water	24 hours from collection to analysis	Cool to <6°C
SW-846 3060A/ 7196A	Soil	30 days from collection to extraction; 7 days from extraction to analysis	Cool to <6°C

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all calibration verification standard recoveries were within control limits of 90% to 110%.

4. Matrix Spike (MS)/Post-Digestion Spike (PDS)/Laboratory Duplicate Analysis

MS, PDS, and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

Soluble and insoluble spike sample analyses are designed to provide information about the effect of the sample matrix on the digestion and measurement methodology. The insoluble spike is used to evaluate the dissolution during the digestion process. Hexavalent chromium must exhibit a percent recovery within

DATA REVIEW REPORT

the established acceptance limits of 75% to 125% in both the soluble and insoluble spiked analyses. The control limits do not apply when the parent sample concentration exceeds the spike amount by a factor of four or greater.

SDG #JC72521: The MS analysis performed on sample location BS-H7D in association with the insoluble and soluble hexavalent chromium analysis exhibited recoveries within the control limits.

SDG #JC72443: The MS analysis performed on sample location BS-D9 in association with the insoluble hexavalent chromium analysis exhibited a recovery within the control limits.

SDGs #JC72443 and JC72616: The MS analysis performed on sample locations BS-D9 and BS-C9 exhibited spike recoveries less than the lower control limits as presented in the table below.

Sample Location	Analyte	Initial Spike Recovery	Reanalysis Spike Recovery
BS-D9	Hexavalent Chromium, Soluble	57.3%	70.7%
BS-C9	Hexavalent Chromium, Soluble	< 50%	< 50%
	Hexavalent Chromium, Insoluble	< 50%	51.1%

The criteria used to evaluate spike recoveries are presented in the following table. The qualifications are applied to all sample results associated with the sample preparation batch. In the event of a recovery outside of the control limits, the MS must be reanalyzed.

Control limit	Sample Result	Qualification ¹
Spike recovery \geq 50% but < 75%	Non-detect	UJ-
	Detect	J-
Spike recovery < 50%	Non-detect	R
	Detect	R
Spike recovery > 125%	Non-detect	No Action
Spike recovery > 125% but \leq 150%	Detect	J+
Spike recovery > 150%	Detect	R

Notes:

¹ If recoveries are < 50% or > 150% for both insoluble and soluble spikes, associated data will be rejected ("R"); otherwise qualify associated data if one of the spikes is outside the < 50% or > 150% limits.

SDG #JC72443: The original analyses of the field samples are usable with appropriate qualification. No sample results were rejected.

SDG #JC72616: The reanalysis of the field samples are usable with appropriate qualification. No sample results were rejected.

4.2 Post-Digestion Spike (PDS) Analysis

The PDS analysis is designed to verify that neither a reducing condition nor a chemical interference is affecting the analysis. This is accomplished by analyzing a second aliquot of the pH-adjusted filtrate that has been spiked with hexavalent chromium. The PDS must exhibit a percent recovery within the method acceptance limits of 85% to 115%.

DATA REVIEW REPORT

The PDS analysis performed on sample locations BS-D9, BS-H7D, and BS-C9 exhibited recoveries within the control limits.

4.3 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to four times the RL. A control limit of 20% is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to four times the RL, a control limit of \pm the RL is used.

The laboratory duplicate analysis performed on sample locations BS-D9, BS-H7D, and BS-C9 exhibited results within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with these SDGs.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REVIEW REPORT

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
pH by SM4500H+B	Water	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
pH by SW846 9045D	Soil	QAPP: 24 hours of receipt at laboratory	Cool to <6°C
Oxidation-Reduction Potential by ASTM D1498-76	Water	Not applicable	Cool to <6°C
Oxidation-Reduction Potential (Redox) by ASTM D1498-76	Soil	Measure immediately after creating leachate	Cool to <6°C
Ferrous Iron by ASTM D3872-86	Soil	24 hours from collection to analysis	Cool to <6°C
Sulfide Screen by SM4500S2-A	Soil	7 days from collection to analysis	Cool to <6°C
Total Organic Carbon (TOC) by Lloyd Kahn	Soil	14 days from collection to analysis	Cool to <6°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Method	Holding Time	Criteria
BS-D9 BS-C9	ASTM D3872-86	Analysis: 5 days	< 24 hours from collection
BS-D9 BS-E10 BS-F10 BS-G10	SW846 9045D	Analysis: 2 days	< 24 hours of receipt at laboratory
BS-H7D		Analysis: 4 days	

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

DATA REVIEW REPORT

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Method blank analysis is not applicable for Redox and pH analyses.

Ferrous iron, sulfide, and TOC were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. All buffer check results were within acceptance limits.

4. Laboratory Duplicate Analysis

Laboratory duplicate data are used to assess the precision of the analytical method. The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of \pm the RL is applied.

The laboratory duplicate analysis was not performed using a sample from these SDGs.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate sample was not collected in association with these SDGs.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

LCS results for redox potential, pH, and sulfide screen were not reported in the analytical report.

DATA REVIEW REPORT

The LCS analysis performed in association with ferrous iron and TOC exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.
